DISSERTATION OUTLINE

AUTHOR: Charles L. Alcorn, Supervising School Psychologist,
Peoria Public Schools, Peoria, Illinois

TITLE: A Multivariate Analysis of Two Types of Conforming Behavior

PROBLEM: What variables constitute the personality pattern of those persons who
"conform" to either expert or group pressure?

METHOD: PHASE I

Utilizing seventeen (17) variables, 118 subjects shall be placed in an "Asch-type" or "Crutchfield-type" situation, utilizing a modified Tuddenham apparatus. "Discriminant weights" shall be derived via use of the Step-wise Multiple Discriminant Function Analysis. All data shall be processed via IBM 1401, with FORTRAN FOUR language.

PHASE II

These data shall be then used to predict the behaviors of 217 subjects in identical conformity-situations, thus validating the discriminant weights and their predictive efficacy. Chi Square data analysis is indicated.

A narrative description, quantified and validated, shall be written to describe the personality patterns of persons who "conform" both to group and to expert pressure, and of persons who "do not conform" to these types of pressure.

STATUS: Data has been collected, statistically analyzed, and the writing process (Turabian's Manual) is underway.

SUBMITTED: 3-2-71

ABSTRACT

A Multivariate Analysis Of Two Types Of
Conformity Behaviors

by

Charles Lee Alcorn

Walden University

1972

ABSTRACT

A review of research concerning conformity behaviors revealed a need for large sample, multivariate approaches.

To that end, seventeen variables were utilized (birth order, chronological age, sex, race, IQ, socioeconomic status, geographic area of residence, religion, anxiety, dogmatism, rigidity, acquiescence, ego strength, confidence, extroversion/introversion, impulsivity, and neuroticism) to describe the behaviors of 104 subjects in a Tuddenham-type setting wherein the subjects were randomly assigned to either "Asch-type" (group pressure) or "Crutchfield-type" (expert pressure) treatment conditions.

Utilizing a stepwise multiple discriminant function analysis, discriminant weights were derived. The variable of rigidity was not found to be a valid predictor.

With the discriminant weights and the sixteen predictive second-order variables, 218 subjects were randomly assigned to treatment conditions and their "conforming" or "not-conforming" behaviors were predicted. The data of eleven subjects who correctly perceived the contrived nature of the experiment were not included.

Of the 123 subjects subjected to "expert pressure," 85 were not-conformers. Chi-Square analysis of the "expert pressure" data yields a significant difference at the .20 Level of Confidence. Of the 95 subjects subjected to "group pressure," 45 were conformers and 50 were not-conformers. Chi-Square was not significant.

Conformers to "expert pressure" were correctly identified 74 per cent of the time; conformers to "group pressure" were correctly identified 62 per cent of the time. Thus, it appears that conforming behaviors are predictable providing a multivariate method is used conjointly with a discriminant function analysis of the data.

The most difficult behavior to correctly predict is not-conforming to "expert pressure," with but 32 per cent correct. Too, but 40 per cent of the not-conforming to "group pressure" was correctly predicted.

Conformers to "expert pressure" were seen as typically being first-born, 20.8 year old Caucasian males or females with an IQ of 114. Their parents were high school graduates or above, and were either professional persons, business proprietors, or managers, et cetera. Their geographic area of residence was Rural East North Central United States, but this finding may be due to sampling error. Protestants were more frequently observed ($n = 54$) than Roman Catholics ($n = 28$). The conformers were slightly above average in anxiety and dogmatism. Average acquiescence, ego strength, and confidence were noted. Low impulsivity was seen, and they were slightly extroverted. As a group, they were more neurotic than an average subject.

Not-conformers to "expert pressure" were seen as first-born 21.5 year old Caucasian males with an IQ of 119. No clear socioeconomic status was noted due to extreme scatter. The geographic area of residence was Rural East North Central United States. They were predominantly Protestant subjects.

They were less anxious than conformers, less dogmatic, and less acquiescent. They did not differ significantly in ego strength, confidence or impulsivity. However, they were more introverted and decidedly less neurotic than their conformer counterpart.

Conformers to "group pressure" were equally likely to be either a first or second-born 21 year old male or female Caucasian Protestant with an IQ of 116.

They were more anxious than an average subject. Dogmatism, acquiescence, ego strength, neuroticism, and extroversion/introversion were average. As a group, they were slightly more confident.

Subjects who were not-conformers to "group pressure" were seen as second-born 21.5 year old females with an IQ of 116. Two-thirds of these subjects were Protestant; one-third were Roman Catholic. No obvious socioeconomic status could be ascertained. They were less anxious than conformers to "group pressure." No significant differences were noted in dogmatism, acquiescence, ego strength, confidence, impulsivity or extroversion/introversion. They were less neurotic than their conformer counterpart.

ACKNOWLEDGMENTS

The author wishes to acknowledge the interest, encouragement, and helpful efforts of Dr. Ralph Marty, Professor of Education and Chairman of the Division of Teacher Preparation, McKendree College. Too, the yeoman work of Mr. and Mrs. Jerry Clark and Mr. Alan Fisher in the task of gathering much of the data is recognized. And, obviously, the sustained interest of a supportive family was an irreplaceable asset.

ABSTRACT

A multidimensional descriptive study of the personality patterns of subjects typified by two types of conforming behavior and two types of not-conforming behavior. A technique for predicting such behaviors is developed by use of the multiple discriminant function analysis, using seventeen organismic variables. The description of the "conforming personality types" is of special concern.

CHAPTER I

INTRODUCTION

Rationale

In modern society one can observe multitudinous instances of human behaviors being molded, altered, and irrevocably affected by varied influences. Of particular concern to many is the effect of "social pressure" and "expert opinion." Needless to say, "conforming behavior" greatly transcends any human parameter.

What, we might ask, characterizes those who "go along with the crowd" as opposed to those who do not? What ipsative or idiographic variables contribute to "giving in," to "yielding," to "believing," et cetera?

If those in the professions of education and social science could ascertain, via rigorous scientific methodology, specific variables that could be manipulated to permit mankind to resist "pressure" and to think for himself with independent logic, might not a better world possibly ensue?

As a behavioral phenomenon, "social pressure" has received increasing attention over the past three decades. From the classic works of Sherif (1935), Asch (1951, 1956), and Crutchfield (1955) have come extensively researched theories regarding the qualities, effects and types of social pressure. Sherif (1935, 1948) was concerned with the effects of social factors "coming from without" such as suggestion and group pressure, and of such internal

factors as motivation and attitudes, as they might affect a person's perception in the "autokinetic phenomenon" situation. Asch (1951, 1956) investigated the effects of group pressure upon one's judgment, and in his studies, typically, a single subject was influenced by the judgments of a unanimous majority. Crutchfield (1955) utilized another methodology wherein a number of subjects could be tested simultaneously via an electrical apparatus, thus permitting standardized situations for each subject. There appear to be numerous factors that contribute to social pressure, including broad areas such as interpersonal relationships, personality variables, and the very nature of the social pressure situation itself. (Chipman, 1966)

Hollander and Willis (1967) commented on the use of value judgments by the behavioral scientist and on the somewhat restricted approaches in conformity studies. In their opinion behavioral scientists should not make value judgments about the desirability or lack of desirability of conformity in human behavior. They also recommend that research in this general area should be characterized by a broad, multidimensional investigation which would not attempt to isolate narrow, segmented aspects of the conforming personality. Rather, multivariate research is advised in an attempt to ascertain the global construction of the conformer personality pattern. To that end, this research would center itself around the question of ascertaining exactly what the variables and pattern of variables are that

describe the person who will conform to social pressure.

A review of the considerable literature involving conformity behavior points to two basic unresolved problems. First, the problem of trying to determine precisely which personality trait is present when conformity occurs has resulted in many small studies dealing with but one or two independent variables. This further has resulted in contradictory findings, and there are many differing statements as to which variables do, in fact, relate to conformity. Secondly, there have been numerous investigations described as "Asch-type," where a subject is influenced by group opinion, as well as "Crutchfield-type" studies in which subjects are manipulated by the use of simulated influences. There apparently has not been an investigation of the specific personality patterns of subjects in both of these unique experimental conditions done by the same researcher. It would appear that there is, in fact, not a single entity known as a conformer, and that the behavior manifested in an "Asch-type" situation might very well not be seen in the same subject when he is placed in a "Crutchfield-type" experiment.

It is the aim of this research to ascertain the specific personality characteristics of those people who do indeed conform or not conform when influenced by "group pressure" or by "expert pressure." "Group pressure" is an experimentally-contrived situation wherein the independent

judgment of a naive subject is "placed under pressure" by the uniformly false answers of other subjects (Crutchfield, 1955), and "expert pressure" is a similar situation except that another person serves as an "expert" and is known to be "apt" at the experimental task. (Luchins, 1961) It is anticipated that, in fact, there is more than one conformer personality pattern, and the exact type of situation in which one finds himself will also determine whether one does not conform.

Factors Affecting Conformity

Among the interpersonal factors investigated previously are such variables as the size of the group, the subject's status, the effect of peer group versus non-peer group, and the public nature of the commitment involved in stating a conforming opinion, et cetera. Personality factors have provided perhaps the majority of research works and also the most contradictory results.

Demographic Variables

Personality dynamics. The studies by Breger (1963), Hoffman (1953), and Mussen and Kagan (1958) have identified the central role of repressive ego-defenses in the conforming individual. According to Breger's research (1963), "Conformity is conceptualized as part of an ego-defensive process centered around the repression of hostility," and he points to "the usefulness of conceptualizing acquiescence to group pressure in terms which incorporate the portion of psychoanalytic theory concerned with defensive processes."

Covert hostility (Breger, 1963) is said to correlate with conformity. Asch's (1962) observations that the conforming subjects tend to block from awareness and distort the pressure in the group situation and in their own conforming responses emphasize defenses as central to the personality of the conformer.

The phenomenon of anxiety has been a fruitful research area. The findings, however, vary from study to study. Walters (1960) and Meyers (1962) indicate a positive relationship between conformity and high anxiety levels. The conditions under which the behavior did or did not occur were not standardized, however. Meyers and Hohle (1962), using a simulated group procedure, report a small but significant correlation between conformity and anxiety as assessed by the Sarason-Mandler TAQ. Walters, Marshall, and Shooter (1960) tested adolescent youths with the autokinetic apparatus and found that those who reported themselves as "anxious" on a "scale" adapted from Schacter were more susceptible to social influence. Mangan (1959, 1960) and Holder (1958) report that high anxiety is characterized not by more, but indeed by less conformity. Holder (1958) correlated the "conformity scores" on his Inventory of Value Integration with the Welch Anxiety Index on the MMPI and found that low conformers had the lowest anxiety mean. With subjects in a Crutchfield-type apparatus, DiVesta and Cox (1960) found a significant correlation of .17 between anxiety scores on the Manifest Anxiety Scale

and conformity. Mangan, Quartermain and Vaughan (1960) utilized an Asch-type setting and found that "under strong pressure conditions" those subjects who had high scores on the Taylor Scale of Manifest Anxiety conformed less than subjects with low anxiety scores.

There does not appear to have been a definitive experiment to resolve these conflicting findings.

Smith (1961) found that one's ego strength was related to one's perceived competence, and that those subjects with high ego strength yielded less under pressure. Weiner's (1958) results would seem to corroborate this, for he found that subjects with a high "Certainty Scale Score" were more certain of their judgment of ten mimeographed ambiguous designs and did not change their judgments as frequently as those subjects with a low "Certainty Scale Score."

Social Factors

Subjects described as being of "indefinite status" insofar as their popularity was concerned were found to yield more than either the "popular" or "unpopular" subjects (Wilson, 1966). Strickland (1962) found that conformity under simulated group pressure conditions was a result of the subject's need for social approval. Feldman and Goldfried (1962), using a modified Asch-type situation, classified subjects on the basis of an "independent score" that was pre-determined by the subject's agreement or non-agreement with an "incorrect" majority response. "High independent subjects" tended to make significantly more

independent choices, while the "Low independent" group tended to go along with the majority. Gross (1959) indicates that "differential social pressure" will result in different amounts of conformity in subjects described as "insecure." He defines "strong pressure" as the subject having to make a public judgment before his influencing peers, "intermediate pressure" as a not-public judgment being made before the influencing peers, and "weak pressure" as a private judgment being made without peer influence. "Strong pressure" was found to produce the largest number of conforming responses in a guessing task.

Dogmatism

Harvey (1963) utilized a multivariate approach, wherein he varied the type of influence as well as the stimulus magnitude. In his opinion, "conformity is a complex adjustment to both situational and personality factors." In a simulated group situation, he found that "high dogmatism" on the Rokeach Dogmatism Scale conformed more than did the "low dogmatics." Lefcourt (1962), in assessing readiness for therapy in narcotic addicts, did indeed find that those subjects considered to have the greatest "potential for change" had the lowest scores on Rokeach's Dogmatism Scale (1954).

Authoritarian personality

Unfortunately, research with this variable has yielded contradictory findings. Youniss (1958) reports finding no correlation between authoritarian characteristics and

conforming behavior. Vidulich (1961) indicates that subjects described as "high authoritarian" persons agree more with high status sources, indicating that the source of the information is a relevant variable. Steiner (1963) points out that an authoritarian personality does not necessarily conform in a situation; rather, he may be a non-conformer when his associates are not unanimous in their opinions.

Rigidity

The personality characteristic of rigidity, implying a lack of flexibility in behavior and attitude, has apparently not been included in previous multivariate research concerning conformity.

Sex of subject

As a determining variable in conformity behavior research, the sex of the subject has received considerable attention. Numerous studies (Tuddenham, 1958; DiVesta, 1960; Patel, 1960; Allen, 1963; Peterson, 1963) have yielded the general finding that females are more susceptible to influence and do conform more than males.

IQ

Intelligence, when considered as a predictor variable, has yielded somewhat less than consistent findings. Youniss (1958) found that in a group situation there was no correlation between IQ and conformity. Other works (Ratcliffe, 1956; DiVesta, 1960; Peterson, 1963; Smith, 1964) indicate generally that there is an inverse relationship between conformity and intelligence. In a

study dealing with bright and dull children, Lucito (1964) also reported such an inverse relationship.

Age of subject

This factor has not been as frequent a topic for research as one might expect. However, DiVesta (1960) reports a negative correlation between conformity and subject's age.

Birth order

Conflicting results are seen from studies utilizing birth order as a predictor of behavior. Becker (1966) found a differential manner of response in certain subjects, in that first-born subjects were more responsive to normative, group influence than were later-born subjects. These later-born were found to be more responsive to informational influences. Thorne (1963) indicated that birth order did not influence conformity behavior.

Experimental Situation Variables

The conditions under which conformity behavior has been produced vary considerably in type. They have ranged from the classic studies of Asch (1951, 1956) wherein a single subject was influenced by a unanimous group of supposed peers, to the work of Crutchfield (1955) and his machine-manipulation of groups of subjects. Peer and/or group influence, "expert opinion," the amount of personal commitment, et cetera, have all been used as experimental variables in attempting to predict conforming behaviors.

Reward and punishment as independent variables have yielded diverse results. French (1960) indicates that coercive power and punishment cause conformity. Gorfain (1960) reports, however, that reward does not affect the amount of yielding behavior. Endler (1965) utilized a methodology wherein one group of subjects received conformity reinforcement every time they agreed with a contrived consensus, and another group was similarly reinforced every time they disagreed with a contrived group consensus. The results seemed to indicate that reinforcement for conforming behavior increased such behavior, and, likewise, reinforcement for disagreeing decreased conformity responses.

CHAPTER II

PROBLEMS

It appears that the marked inconsistency of findings concerning those personality traits contributing to conformity behavior points to an obvious need for further and more definitive investigation. In addition, the majority of previous researches have consisted of unidimensional approaches. Even though we have a great many traits purportedly predictive of conformity, because they are described in mainly univariate studies there is no means that will allow us to predict which is singularly most important.

The problem thus seems to consist of four aspects: First, there is a need to determine whether there is, or is not, a conformer personality pattern generic to each type pressure situation described as "group" or "expert" pressure; second, if such personality patterns exist, can a prediction equation be constructed; third, if a predictive equation can be constructed, it will give an answer to the relative importance of the variables previously found to be related to conformity behavior; fourth, if a prediction equation is derived, it should be validated, thus permitting a definitive statement to be made as to the precise personality pattern that leads to conformity behavior in different pressure situations.

CHAPTER III

METHOD

PHASE I

This research attempted to discover the relationships, if any, between specific predictor variables and the criteria of conformity behaviors under conditions of "group" or "expert" pressure.

The first order predictor variables whose effects were to be investigated were as follows:

1. Birth order
2. Chronological age of subject
3. Sex of subject
4. Race
5. Intelligence, using the California Test of Mental Maturity, Short Form, (1958 Ed.)
6. Socioeconomic status of subject
7. Geographic areas of residence
8. Religion
9. Anxiety, using the IPAT Anxiety Scale Questionnaire, Form A (1957)
10. Dogmatism, using the Rokeach Dogmatism Scale (1954)
11. Rigidity, using the Gough-Sanford Rigidity Scale, as abstracted from the California Personality Inventory, (1956) by special permission of the author.
12. Acquiescence, using the 70 item scale of the "Yeasayers and Naysayers Agreeing Response Set" high and low mean scale. (Couch, Kewiston 1960)

13. Ego Strength, using the IPAT Anxiety Scale Questionnaire, Form A (1957).
14. Confidence, using the Saunders Self-Sufficiency Scale, as abstracted from the IPAT 16 P.F., Form A (1957).
15. Extroversion/Introversion, using the Eysenck Personality Inventory, Form A (1968).
16. Impulsivity, using the Barratt Impulsivity Scale, by special permission of the author.
17. Neuroticism, using the Eysenck Personality Inventory, Form A (1968).

These assessments and measurement techniques were utilized because of their accepted use in previous conformity research (Harvey, 1963; Rokeach, 1954; Youniss, 1958; Tuddenham, 1958; DiVesta, 1960; Peterson, 1963; Becker, 1966; Thome, 1963; Walters, 1960; Meyers, 1962) as well as for the customary criteria of validity and reliability.

Their \bar{X} s, S.D., and other measures of distribution are noted in Table I.

TABLE I

SCORE DISTRIBUTION ON ASSESSMENT INSTRUMENTS

<u>VARIABLE</u>	<u>INSTRUMENTS</u>	<u>DISTRIBUTIONS</u>
Anxiety	<u>IPAT Anxiety Scale Questionnaire</u>	Stens; all Ss were scored by sex and education $\bar{X} = 5.5$
Dogmatism	<u>Rokeach Dogmatism Scale</u>	$\bar{X} = 23$
Acquiescence	Couch-Keniston Acquiescence Scale, using the 70 item scale of the "Yeasayers and Naysayers Agreeing Response Set" high and low mean scale.	70 items Range: 0-70; high score = high "agreeing response set;" low score = low "agreeing response set;" $\bar{X} = 33$
Ego Strength	<u>IPAT 16 P.F., "Ego Weakness:" subtest, Form A</u>	Stens; all Ss were scored by sex and education $\bar{X} = 5.5$
Confidence	<u>IPAT 16 P.F., Q2, Q3, Q4 of Form A, B, and C. (Formerly used as Saunder's Self-Sufficiency Scale)</u>	Range: 0-99; $\bar{X} = 33.5$
Extroversion/ Introversion	<u>Eysenck Personality Inventory, Form A</u>	Raw Score of 11-12= 42 to 52 per cent of college students. $\bar{X} = 13.1$, S.D.=4.1
Impulsivity	Barratt Impulsivity Scale (by special permission of the author)	85 items; high score= high "impulsivity;" low score = low "impulsivity."
Neuroticism	<u>Eysenck Personality Inventory, Form A</u>	Raw Score of 9-10= 48 to 55 per cent of college students; $\bar{X} = 10.9$, S.D.=4.7
Rigidity	Abstracted from <u>California Personality Inventory</u> (by special permission of the author)	Range 0 to 21; high "True" score equate with high "rigidity."

The "geographic area" of each subject was ascertained by utilizing the nomenclature of the United States Bureau of the Census' 1960 publication. The United States was divided into nine major areas, and further subdivided into the three classifications of "Urban," "Borderline," and "Rural," as noted in Table II.

The subject's socioeconomic status, or "SES," was evaluated on the basis of the father's occupation and his number of years of education. The subjects were rated on a linear continuum (numerical scale) of 2 to 24. The numerical score was based upon the numerical values obtained from the dichotomization indicated in Table III. (Warner, Meeker, Eells, 1960)

TABLE III

SCHEM FOR RATING SOCIOECONOMIC
STATUS OF SUBJECT

Rating	Professionals	Proprietors and Managers	Business Men	Clerks and kindred workers, etc.	Manual Workers	Protective and Service Workers	Farmers
1	Lawyers, doctors, dentists, engineers, judges, high-school superintendents, veterinarians, ministers (graduated from divinity school) chemists, etc. with post-graduate training, architects	Businesses valued at \$75,000 and over	Regional and divisional managers of large financial and industrial enterprises	Certified Public Accountants			Gentleman farmers
2	High-school teachers, trained nurses, chiropodists, chiropractors, undertakers, ministers (some training), newspaper editors, librarians (graduate)	Businesses valued at \$20,000 to \$75,000	Assistant managers and office and department managers of large businesses, assistants to executives, etc.	Accountants, salaried men of real estate of insurance, post masters			Large farm owners, farm owners
3	Social workers, grade-school teachers, optometrists, librarians (not graduate), undertaker's assistants, ministers no training	Businesses valued at \$5,000 to \$20,000	All minor officials of businesses	Auto salesmen, bank clerks and cashiers, postal clerks, secretaries to executives, supervisors of railroad, telephone, etc., justices of the peace	Contractors		
4		Businesses valued at \$2,000 to \$5,000		Stenographers, bookkeepers, rural mail clerks, railroad ticket agents, sales people in dry goods store, etc.	Factory foremen, electricians)-own plumbers)-business carpenters)-ness watchmakers)	Dry cleaners, butchers, sheriffs, railroad engineers, road conductors and conductors	
5		Businesses valued at less than \$500		Dime store clerks, hardware salesman, beauty operators, telephone operators	Carpenters, plumbers, electricians (apprentices), time-keepers, linemen, telephone or telegraph, radio repairmen, radio- skill workers	Barbers, firemen, butcher's apprentices, practical nurses, policemen, seamstresses, cooks in restaurant, bartenders	Tenant farmers
6					Molders, semi-skilled workers, assistant to carpenter, etc.	Baggage men, night policemen and watchmen, taxi drivers, gas station attendants, waitresses in restaurant	Small tenant farmers
7					Heavy labor, migrant work, odd-job men, miners	Janitors, scrub-women, newsboys	Migrant farm laborers

FOLLOWING RATING WAS USED FOR EDUCATION:

- 8 Professional or graduate school
- 9 College education (1 to 4 years)
- 10 High school graduate
- 11 One to three years of high school
- 12 Grammar school graduate (finished 8th grade)
- 13 Four to seven years of school
- 14 Zero to three years of school

PHASE ISubjects

104 randomly selected undergraduate students at a private, Methodist-affiliated Midwestern liberal arts college were evaluated on the basis of the 17 aforementioned predictor variables.

Apparatus

The apparatus used in this study is functionally related to the equipment used by Tuddenham (1960) to study conformity in group situations.

Drawings of the apparatus are contained in Illustrations I and II.

A modification of Tuddenham's standardized items was employed. (See appendix P) Each S had a panel upon which he could indicate an answer choice among nine or less possible answers by pulling the appropriate switch. Whenever the Ss activated a switch their responses were seen as a light on the E's panel; however, S's choices were irrelevant as the situation was a contrived one.

TESTING AREA

MASTER PANEL

The Ss were tested in separate compartments, making it possible to run simulated groups as well as Ss and an "expert." E's panel was so wired that he could communicate with each S. Each S's panel contained an amber, a green, and a red light under the control of the E. The amber light was used to indicate to S that they must make a new decision and either change or affirm their previous response. The green and red light indicated that their initial answer was "in agreement" or "not in agreement" in each choice situation. S's new decision was indicated by their use of the appropriate switch.

As aforementioned, the various psychological assessments utilized were those, in the main, that had been previously utilized in conformity problems research. Obviously, other measurements could have been utilized. Too, the question of the diverse variabilities and reliabilities of the assessments is acknowledged; however, it is not the purview of this investigation to deal with these concepts specifically.

Birth Order, Chronological Age, Sex, SES, Geographic Area, and Religion were obtained from a questionnaire each S completed.

TABLE IV
QUESTIONNAIRE

1. Your Name: _____
2. Sex: Male _____ Female _____
3. Birth Order: Only Child _____ First-Born _____
Second-Born _____ Third-Born _____
Adopted _____ Other _____
4. Were you reared by your natural parents? Yes _____
No _____
5. Chronological Age: (In Years) _____
6. Is your father living? Yes _____ No _____
7. If your father is living, what is his level of
education?
_____ Thru grade school _____ Thru 8th grade
_____ Thru high school _____ Some college
_____ 4 years college _____ M.S. _____ Ph.D.
_____ other
(If "Other," please be specific.) _____
8. If your father is living, what is his occupation?

9. In what city and state do you permanently reside?

10. To what religious denomination do you belong?

Procedure

The 104 Ss were randomly assigned to either a "Type G: Group Pressure" group or a "Type E: Expert Pressure" group. All Ss were tested in separate compartments, making it possible to compose simulated groups. E's panel was so wired as to make it possible to simulate "group opinion" and "expert opinion" for each S, and the E controlled all simulated responses.

All Ss were presented samples of Tuddenham's thirty conformity problems, each of which has nine alternative answers. For each problem, the Ss chose an answer and signaled it to the E. The Ss were then in return signaled that they were either "in agreement" or "not in agreement" according to the "group" or "expert." Then each S was given an opportunity to change or affirm his answer and to signal his final decision.

For all problems except 1, 2, 3, 7, 13, 23, and 27 the S's response was followed by a signal from the E indicating that the S was "not in agreement" according to the "group" or "expert." Problems 1, 2, 3, 7, 13, 23, and 27 were signaled as "in agreement" responses.

The coincidence of answers to problems 1, 2, 3, et cetera, was to minimize S insight into the purpose of the study.

"Conforming behavior" is defined as the S's changing their response more than fifty percent of the time. In a

two-choice situation the probability of a single response being made is precisely "even," fifty-fifty, or one of two chances. Hence, if a subject shows a significantly higher number of conforming responses, the variables of "group" and "expert" pressure have had a significant effect.

This procedure yielded four groups of Ss:

"Type G₁ : conformity to group pressure"

"Type G₂ : not-conformity to group pressure"

"Type E₁ : conformity to expert pressure"

"Type E₂ : not-conformity to expert pressure"

The term "not-conformity" was used to specifically avoid the problems germane to the use of the term, "non-conformist." It should be noted that no statements are offered to describe, operationally, a "non-conformist."

Results

A "Stepwise Multiple Discriminant Function Analysis" computer program to investigate the existence of characteristics which would distinguish the four groups of Ss produced by the conformity situation was used. Regression equations for the prediction of each type of "conformity" and "not-conformity" were computed.

The data were processed via an IBM 1401 computer at the Southern Illinois University-Edwardsville Branch, at Edwardsville, Illinois. FORTRAN 4 language was utilized. This program is quite similar to "Multiple R" in that it ascertains which specific variable to eliminate initially, to wit, the one that accounts for the least amount of variance. Then, "discriminant weights" were computed for each variable.

Table VI indicates the discriminant weights at the .04 level of confidence for the E_1 and E_2 group. The G_1 and G_2 weights are significant at the .01 level of confidence.

Data analysis indicates that there were, indeed, different variables contributing to the various conforming or not-conforming behaviors. Perusal of the data "print-out" yielded the following findings:

For the Type G₁ and Type G₂ S's, deletion of the variable "Impulsivity" yielded an R² of .40, F = 1.35, P = .16; deletion of "Rigidity" yielded an R² of .40, F = 1.48, P = .10; deletion of "Neuroticism" yielded an R² of .40, F = 1.62, P = .06; and deletion of "Religion" yielded an R² of .40, F = 1.76, P = .03. Deletion of these variables yields significance at the .03 Level of Confidence.

For the Type E₁ and E₂ S's, deletion of the variable "Ego Strength" yielded an R² of .36, F = 1.15, P = .32; deletion of "Dogmatism" yielded an R² of .36, F = 1.25, P = .23; deletion of "Chronological Age" yielded an R² of .36, F = 1.35, P = .15; and deletion of "Rigidity" yielded an R² of .36, F = 1.50, P = .08 Level of Confidence.

As anticipated, these data, and the resultant discriminant function weights, enabled E to predict the specific behavior that a S would demonstrate when subjected to a conformity situation by utilizing the "second-order" variables.

PHASE II

Subjects

The appropriate predictor instruments were given to 218 randomly selected students attending the same private, Methodist-affiliated Midwestern liberal arts college and were evaluated using the discriminating second order variables found in Phase I. On the basis of their scores on the predictor instruments, their performance under "Type E" and "Type G" pressure was predicted.

Apparatus

The apparatus was the same as used in Phase I.

Procedure

218 Ss were randomly assigned to either "Type E" or "Type G" condition. The procedure was the same as used in Phase I and the criterion for determining "conformity behavior" was the same as used in Phase I.

At the conclusion of the procedure, each S was asked, "What do you think was the purpose of this study?" Those Ss correctly perceiving the purpose were excluded as their data would not be pertinent; a total of 11 Ss were thus excluded.

A total of 123 subjects were placed in the expert pressure situation and 95 subjects were placed in the group pressure situation. Analysis of these data by Chi-Square yielded results as follows:

Chi-Square Analysis

$$E_o = 73 \quad G_o = 47 \quad E_e = 61.5 \quad G_e = 41.7$$

$$\text{Chi-Square}_E = 1.9$$

Significant at the .20 Level of Confidence

$$\text{Chi-Square}_G = 0 \text{ not significant}$$

From these data the question of which specific type behavior is most efficiently predicted can be answered when we note that those subjects predicted to be conformers to expert pressure were correctly identified 74 per cent of the time. Further, those subjects who were predicted to conform to group pressure were predicted correctly 62 per cent of the time. Thus, we may conclude that it is obviously a facile task to identify the Ss who are conformers in either pressure type situations.

Further, the question might be asked as to which specific type behavior, of the four possible, is most difficult to predict. We note that those subjects who were predicted to not conform to expert pressure were correctly identified only 32 per cent of the time. Those subjects that were predicted to not conform to group pressure were correctly identified only 40 per cent of the time. Thus, the not-conformer to expert pressure is the most difficult behavior to predict. The largest

sources of error appear to be found when, first, predicting the expert pressure "not-conformer," and, second, when predicting the group pressure "not-conformer."

The over-all correct prediction rate is ascertained at 56 per cent of the time. While occurring at an "above chance" level, it is opined that by utilizing the second order variables and the assessments previously described, this prediction rate is not sufficiently high to warrant a highly certain or dogmatic description of the personality constellations of any type subject.

It is interesting to note that of the total number of subjects utilized, 60 per cent of them conformed at all times regardless of the types of pressure. This indicates that when the subject was predicted to be a not-conformer, 60 to 68 per cent nevertheless, did conform.

Further analysis of the data indicates that of those subjects subjected to expert pressure, 69 per cent conformed and of those subjects subjected to group pressure only 41 per cent conformed.

It is offered by way of possible explanation of why so few of the E_2 subjects were correctly predicted that the low n in the pilot phase of the study may have led to ineffective discriminant weights being computed. It is obvious that an increase in the total n would increase the "power" of the predictive equation.

CHAPTER IV

ANALYSIS OF DATA

Statistical Description of the conformer and not-conformer to expert pressure.The Conformer to Expert Pressure

According to the data gathered in Phase II, the conformer to expert pressure is typically seen as follows:

They are, most frequently, a first-born, 20.8 year old individual.

They are, as a group (n = 85), equally divided between males and females. They are, as a group, members of the Caucasian race with an approximate IQ of 114.

The socioeconomic status of the subjects was found to range within the 2 to 7 classification (according to Warner) with the largest single group of subjects achieving a rating of 5. This would point to parents who were high school graduates or above and who were either professional persons, business proprietors, or managers, et cetera.

As a group, their geographic area of residence was mostly seen as that of the Rural East North Central United States which would indicate they came from cities with populations below 25,000 within the states of either Michigan, Ohio, Indiana, Illinois or Wisconsin. It must be noted, however, that this finding is very probably spurious and is germane to the restrictive nature of the population choice involved. No fruitful attempt could be made to obtain a

genuinely selective-representative sample according to the national distribution of the population. Hence, the findings are not considered to be relevant or valid for predictive purposes. Their religion was, on an almost two-to-one basis, Protestant (n = 54) as opposed to Roman Catholic (n = 28).

Anxiety

They were found to have only "slightly above average anxiety" with a stanine of 6.5 on the IPAT Anxiety Scale Questionnaire, Form A, (1957) which is only slightly above an average score. An average score on this assessment is considered to be within a 4 to 6 stanine range.

Dogmatism

Insofar as dogmatism is concerned, they were found to be, again, only "slightly above average" in dogmatism with a score of 24.2 on the Rokeach Dogmatism Scale (1954) compared with a \bar{X} of 23 reported by Rokeach (1954) in his research.

Acquiescence

The amount of acquiescence they demonstrated was found to be certainly within "average" limits. As we note, according to the authors of the test, a \bar{X} of 33 indicates an average "agreeing response set." The subjects in the E_1 group achieved an \bar{X} of 33.3.

Ego Strength

In ego strength they were found to be relatively "average" with a stanine of 6.5 on the IPAT Anxiety Scale

Questionnaire, Form A, (1957) which would indicate that a subject in this group is not typified by "ego weakness."

Confidence

They were found to be of "average" confidence, obtaining a \bar{X} of 33.5 on the Saunders Self-Sufficiency Scale, which is considered to be identical to the \bar{X} described by the test author (1957).

Extroversion/Introversion

They were found to be, when compared with college students in the Eysenck standardization sample for the Eysenck Personality Inventory, Form A, (1968), slightly extroverted with a \bar{X} of 13.1 which is identical to the standardization sample \bar{X} .

Impulsivity

They were not found to be "exceptionally" impulsive, having obtained a \bar{X} of 28.3 on the Barratt Impulsivity Scale; this may be considered to be an indication of "low impulsivity."

Neuroticism

They were found, however, to be relatively "more neurotic" than the sample of college students obtained by Eysenck for the Eysenck Personality Inventory (1968). In his standardization sample, he obtained a \bar{X} of 10.9 to comprise 48 to 55 per cent of college students; the conformer to expert pressure obtained a mean neuroticism score of 12.1 which would indicate they are, as a group, slightly more neurotic than the average college student.

The Not-Conformer to Expert Pressure

It should be noted that the relatively small number of 38 subjects must be carefully kept in mind as description of the not-conformer to expert pressure is attempted. The author is cognizant of the hazards involved in small sample research, and thus the data are interpreted but tentatively and with caution.

These subjects were found to be, in the great majority of cases, first-born individuals with an average age of 21.5. Insofar as the sex of the subjects was concerned, there were slightly more males in the group than females (22 males, 16 females) and they were, by far in the majority, members of the white race.

They were found to be slightly more intelligent than the conformer to expert pressure, having a \bar{X} IQ of 119 as opposed to a conformer \bar{X} IQ of 114. It may thus be hypothesized that the not-conformer to expert pressure is a more intelligent individual with an IQ approaching the upper limits of the "bright normal" range.

The social status evaluation of these subjects was characterized by an extreme amount of scatter with no singularly identifiable group having a clear-cut majority. They were, as a rule, of lower SES than the subjects who were identified as conformers.

Their geographic area of origin was found to be the same as that of the conformer which would possibly indicate that the geographic area from which the subjects originated

was not a particularly strong (contributing to, or accounting for the variance) variable insofar as this group of subjects was concerned.

Anxiety

As a group (n = 38) they were somewhat less anxious than the conformer. The conformer mean anxiety score on the IPAT Anxiety Scale Questionnaire, Form A, (1957) was 6.5, and the not-conformer mean anxiety score was 5.9.

Dogmatism

Also, they were slightly (not significantly) less dogmatic with a mean of 23.2 as contrasted with a conformer mean of 24.2 on the Rokeach Dogmatism Scale (1954). Less in possession of an "agreeing response set," they had a mean of 32.9 as compared to 33.9 for the conformer group on the California Personality Inventory (1956).

They were found to be basically the same in ego strength with a mean of 6.4 as compared with a mean of 6.5 on the IPAT Anxiety Scale Questionnaire, Form A, (1957).

Insofar as confidence is concerned, they had a mean of 32.8 compared to a mean of 33.5 on the Saunders Self-Sufficiency Scale (1957).

They were, however, more introverted than the conformer. It was noted that the conformer group obtained a mean score of 13.5 while the not-conformer group obtained a mean score of 11.8 on the Eysenck Personality Inventory, Form A, (1968).

There would seem to be no significant difference between the subjects on the variable of impulsivity as the not-conformer group obtained a mean of 27.9 compared to a conformer group mean of 28.3 on the Barratt Impulsivity Scale.

However, it should be noted that the not-conformer was decidedly less neurotic than the conformer, with the conformer obtaining an Eysenck Personality Inventory, Form A, (1968) mean neuroticism score of 12.1 and the not-conformer obtaining a mean score of 9.9, which is strikingly lower than the mean neuroticism score obtained by Eysenck for college students.

Statistical Description of the conformers and not-conformers to group pressure.

The Conformer to Group Pressure

Those subjects who conformed to group pressure are seen as being either a first-born (n = 19) or second-born (n = 13) individual of 21 years of age. They were equally divided between male and female sex and were almost all members of the white race. They obtained a mean IQ of 116 and yielded no clear-cut socioeconomic status. They were, in the majority, within the SES range of 2 to 8 with the largest single group (n = 10) in the 5 classification, closely followed by (n = 7) 8 and (n = 6) 7 and 3. They originated, insofar as geographic area is concerned, from the Rural East North Central United States area and were predominately Protestant subjects.

Anxiety

Their anxiety score \bar{X} of 6.6 on the IPAT Anxiety Scale Questionnaire, Form A, (1957) indicates that they are slightly "more anxious" than the average subject.

Dogmatism

They were not found to be "dogmatic" subjects, \bar{X} = 23.5, as their score was not significantly different from the mean obtained by Rokeach in the Rokeach Dogmatism Scale (1954) standardization.

Acquiescence

Their acquiescence or "agreeing response set" was not significantly below the mean reported in the California

Personality Inventory (1956) and may be considered to be "average."

Ego Strength

They certainly would seem to indicate average ego strength with a \bar{X} of 5.9 on the IPAT Anxiety Scale Questionnaire, Form A, (1957), although it might be noted that on this variable they are (not significantly) somewhat lower in ego strength than those subjects in the group described as conformers to expert pressure.

Confidence

They are slightly (not significantly) more confident than the average; we note Saunders citing a \bar{X} of 33.5, whereas this group of subjects obtained a \bar{X} score of 34.7.

Impulsivity

They are considered not to be highly impulsive with a \bar{X} of 28.4 on the Barratt Impulsivity Scale.

Neuroticism

They were within normal limits insofar as neuroticism was concerned with a \bar{X} of 11.4 which is not significantly different from Eysenck's reported collegiate \bar{X} of 10.9 on the Eysenck Personality Inventory, Form A, (1968).

Not-Conformers to Group Pressure

The next group, those subjects described as "not-conformers" to group pressure, were as a group more typically the second-born child ($n = 21$) or possibly first-born ($n = 15$) and in some cases third-born ($n = 8$).

However, the group in which we note the majority of the subjects were second-born individuals.

They were, on the average, 21.5 years of age and were, as a group, more typically female than male. Thus, we see initially that the not-conformer to group pressure is seen to be more typically a second-born female.

The subject, too, was more typically a member of the white race. Insofar as intelligence is concerned, there is no apparent significant difference between the conforming subject to group pressure, for, in this group a \bar{X} IQ of 116.2 was obtained. There was no obvious difference insofar as socioeconomic status is concerned in that, for this group, they were extremely evenly divided between groups 2 through 8 and were again most commonly from Rural East North Central United States. Concerning the variable of religion, two-thirds of these subjects were Protestant and one-third were Roman Catholic. Thus, it appears that this group of subjects is characterized as being second-born females with slightly more subjects belonging to the Roman Catholic faith than other groups.

Anxiety

The mean anxiety score of 6.0 is slightly indicative of less anxiety within this group as compared with the conformer to group pressure \bar{X} of 6.6 on the IPAT Anxiety Scale Questionnaire, Form A, (1957).

Dogmatism

There is no significant difference insofar as dogmatism is concerned with a group \bar{X} of 23.2 compared to a conformer \bar{X} of 23.5 on the Rokeach Dogmatism Scale (1954).

Acquiescence

Concerning acquiescence, they obtained a \bar{X} of 33.7 on the California Personality Inventory (1956) as contrasted to a \bar{X} of 32.9 by the conformer group.

Ego Strength

They were of "average" ego strength with a \bar{X} of 5.4, which is not significantly different from the conformer \bar{X} of 5.9 on the IPAT Anxiety Scale Questionnaire, Form A (1957).

Confidence

They were almost identical in confidence, $\bar{X} = 34.8$, with members of the conformers to group pressure group, whose \bar{X} was 34.7 on the Saunders Self-Sufficiency Scale (1957).

Extroversion/Introversion

They are within normal limits insofar as extroversion and introversion is concerned with a \bar{X} of 12.3 on the Eysenck Personality Inventory, Form A (1968).

Impulsivity

Almost identical to the conformer to group pressure, in impulsivity they obtained a \bar{X} of 28.5 compared with a \bar{X} of 28.4 on the Barratt Impulsivity Scale.

Neuroticism

They are not as neurotic as the conformer to group pressure, obtaining a \bar{X} of 10.9 on the Eysenck Personality Inventory, Form A (1968); this is considered to be identical to Eysenck's standardization sample mean.

Interpretation of discriminant weights

It has been noted in review of the literature that various authors had ascertained, via small sample studies which utilized at the most 2 or 3 predictor variables, that specific variables were considered the critical ones in predicting various types of conforming behavior. Examination of the data gathered in this investigation does not corroborate some of the previous findings and does indeed, corroborate others.

However, examination of the data yields an important finding in that the various variables utilized are found to have different predictive values for the specific type of behavior in question. Further, it is noted that these variables are extremely diverse in predictive efficiency. In some types of behavior they are found to be of positive value and in others to be of negative value, and in some behaviors to be of no value whatsoever.

Relevance of Variables as Predictors of
Conformity Behavior

Birth Order

Becker (1966) found that first-born subjects were more responsive to group influence and that later-born subjects were more responsive to informational influence. Thorne (1963) indicated that birth order did not influence conforming behavior.

In this research, it was found that a negative discriminant weight was derived for the variable of birth order across each type of conformity situation.

Predictive Discriminant Weights and

Birth Order Rank

E_1 (n = 85)	E_2 (n = 38)	G_1 (n = 45)	G_2 (n = 50)
-.0162003	-.0146869	-.0565002	-.0578750
1 47	1 21	1 19	1 15
2 21	2 6	2 13	2 21
3 10	3 5	3 8	3 8
4 5	4 3	4 1	4 2
5 1	5 3	5 3	5 3
6 1		6 1	9 1

Age of Subject

DiVesta (1960) reported a negative correlation between conformity and the subject's age.

In this investigation, it was found that the variable of the subject's age does not yield a predictive discriminant weight whatsoever for any type of expert pressure situation and that, in fact, the group pressure subject is the only type subject for which we find a predictive discriminant weight.

Suffice it to say then that the age of the subject is a critical variable in predicting behavior in a group situation, but that it is an irrelevant variable insofar as the expert pressure situation is concerned. By inspection, we note that the not-conformer to expert pressure has the highest chronological age, $\bar{X} = 23.6$. Conjointly, not-conformers appear slightly older than conformers.

Predictive Discriminant Weights and

\bar{X} Chronological Age			
E_1 (n = 85)	E_2 (n = 38)	G_1 (n = 45)	G_2 (n = 50)
-0-	-0-	.0406039	.0426022
\bar{X} CA = 20.8	\bar{X} CA = 23.6	\bar{X} CA = 21.0	\bar{X} CA = 21.5

Sex of Subject

Tuddenham (1958), DiVesta (1960), Patel (1960), Allen (1963), and Peterson (1963) would appear to concur in the finding that females are more susceptible to influence and do conform more than males.

This variable yielded a predictive discriminant weight for each type of conformity situation; however, the relative size of the weights obtained would indicate that the sex of the subject has more predictive value in an expert pressure situation than it has in a group pressure situation. Nevertheless, the variable does appear to be relevant to all types of conformity situations.

Predictive Discriminant Weights and

Sex of Subject

E_1 (n = 85)	E_2 (n = 38)	G_1 (n = 45)	G_2 (n = 50)
.3402595	.3220530	.1662263	.1814081
Male.....45	Male.....22	Male.....23	Male.....24
Female...40	Female...16	Female...22	Female...26

Race of the Subject

It is perhaps difficult to understand why the race of the subject has not previously been included as a predictive variable in conformity research. Perusal of previous studies did not reveal pertinent investigation in the area.

It should be parenthetically noted that in this research the relative size of the sample that was obtained among subjects of the Negro race may well be a contributing factor to the size of the discriminant weight obtained. It is felt that the size of the sample of Negro subjects is too small ($n = 12$) to be of any genuine, valid predictive value.

However, examination of the data indicates that the race of the subject is of predictive value in either type conformity situation, and on the basis of the discriminant weights, the race of the subject is of singular importance in predicting the conforming or not-conforming subject in expert pressure situations.

Moreover, it is also felt that the disproportionate size of the sample of subjects described as belonging to the white race ($n = 206$) may be, in fact, the governing factor. The obtained discriminant weight may not, perhaps, be completely valid.

Predictive Discriminant Weights and

Race of Subject

E_1 (n = 85)	E_2 (n = 38)	G_1 (n = 45)	G_2 (n = 50)
1.4592789	1.4130924	.7921080	.7765087
Negro.....4	Negro.....2	Negro.....1	Negro.....5
White....81	White....36	White....44	White....45

Intelligence

Intelligence as a predictive variable has yielded somewhat less than consistent findings. Youniss (1958) had found that in a group situation there was no correlation between IQ and conforming. Other authors (Ratcliffe, 1956; DiVesta, 1960; Peterson, 1963; Smith, 1964) generally indicated that there was an inverse relationship between conformity and intelligence. Lucito (1964) also reported an inverse relationship between bright and dull children and their conformity situations.

In this research the variable of intelligence, defined as a California Test of Mental Maturity, Short Form, (1958 Ed.) IQ, was found to be a discriminating one and to be relevant to each type conformity situation.

Predictive Discriminant Weights and

Intelligence

E_1 (n = 85)	E_2 (n = 38)	G_1 (n = 45)	G_2 (n = 50)
\bar{X} IQ = 114.2	\bar{X} IQ = 119.0	\bar{X} IQ = 116.0	\bar{X} IQ = 116.2
S.D. = 12.1	S.D. = 10.3	S.D. = 13.4	S.D. = 11.4

Examination of these data indicate that the not-conformers have, collectively, higher IQ's than do conformers.

Socioeconomic Status

Again the literature is typified by a marked paucity of research dealing with the variable of the socioeconomic status of the subject in conformity research.

Wilson (1966) found that subjects who were of "indefinite status," insofar as their popularity was concerned, were found to yield more than either the "popular" or "unpopular" subject. Further, Strickland (1962) found that conforming under simulated group pressure conditions was the result of the subjects' need for social approval. While these researches might indeed be relevant, it must nevertheless be noted that in no previous research cited was an attempt made specifically to assess the effect of SES.

Discriminant weights were found to be present for each type conforming situation.

Predictive Discriminant Weights and
SES of Subject

E_1 (n = 85)	E_2 (n = 38)	G_1 (n = 45)	G_2 (n = 50)
.0118051	.0143494	.0358316	.0388259
2.....13	2.....1	2.....4	2.....5
3.....8	3.....4	3.....6	3.....7
4.....10	4.....7	4.....3	4.....6
5.....22	5.....6	5.....10	5.....6
6.....10	6.....0	6.....3	6.....6
7.....11	7.....6	7.....6	7.....5
8.....4	8.....4	8.....7	8.....7
9.....2	9.....4	9.....3	9.....3
10.....3	10.....4	10.....2	10.....1
11.....1	11.....2	11.....1	11.....3
12.....1			12.....1

Geographic Area of Residence

The review of the literature does not indicate, apparently, any definitive statement as to the predictive efficiency of the subject's geographic area of residence as it pertains to conformity research.

However, it does appear this variable is of predictive efficiency. Noting the discriminant weights obtained, it is seen that the geographic area is of more predictive value in a group situation than it is in an expert situation.

Predictive Discriminant Weights and
Geographic Area of Subjects

Residence			
E_1 (n = 85)	E_2 (n = 38)	G_1 (n = 45)	G_2 (n = 50)
.0037942	.0005346	.0698959	.0687720
4.....3	4.....3	4.....2	7.....2
5.....1	10.....4	7.....1	10.....4
7.....2	11.....2	10.....4	11.....7
10.....8	12.....24	11.....4	12.....30
11.....6	18.....1	12.....33	13.....1
12.....24	19.....2	20.....1	19.....4
16.....1	25.....1		21.....1
	26.....1		25.....1

It may be observed that, as an entity, the not-conforming groups are typified by more subjects who are from the "13" to "26" classification. Thus, the not-conformers show a higher ratio of urban, non-Midwestern residence. Conversely, the conformers as a group show a decided tendency to be rural, Midwestern residents.

Religion

The religion of the subject has seemingly not been researched as frequently as one might anticipate. McClelland (1967) does emphasize the religion of the subject.

However, on the basis of the data obtained, we note that the religion of the subject is found to be a discriminate variable only among those subjects in expert pressure situations.

It does not appear that the religion of the subject has any predictive efficiency in group pressure situations.

Predictive Discriminant Weights and

Religion of Subject

G ₁ (n = 85)	E ₂ (n = 38)	G ₁ (n = 45)	G ₂ (n = 50)
.3424812	.3263638	-0-	-0-
Protestant..54	Protestant..26	Protestant..38	Protestant..36
Catholic....28	Catholic.....7	Catholic.....7	Catholic....13
Jewish.....0	Jewish.....0	Jewish.....0	Jewish.....0
Agnostic.....3	Agnostic.....3	Agnostic.....0	Agnostic.....1

Examination of these data indicate that the Catholic subjects conform to expert opinion four times as frequently as they not-conform; Protestant subjects conform slightly over two times as frequently as they not-conform.

However, in a group pressure situation, the Catholic subjects yield only half as frequently as they do not yield; the Protestant subjects yield but slightly more

frequently than they do not yield. The variable of
Agnosticism is seemingly of no predictive value.

Anxiety

Findings of research concerning the field of anxiety varied greatly. Walters (1960) and Meyers (1962) indicated a positive relationship between conformity and high anxiety levels. The conditions under which the behavior did or did not occur were not standardized; however, Meyers and Hohle (1962), using a simulated group pressure, reported a small but significant relation between conformity and anxiety on the Sarason-Mandler Test Anxiety Questionnaire. Walters, Marshall and Shooter (1962) tested adolescents, using the autokinetic apparatus, and found those who reported themselves as "anxious" on Schachter's scale were more susceptible to social influence. Mangan (1959, and 1960) and Holder (1958) reported that high anxiety was characterized not by more, but indeed by less conformity. With subjects in a Crutchfield apparatus, DiVesta and Cox (1968) found a significant correlation of .17 between anxiety scores and conformity. Mangan, Quartermain and Vaughan (1960), utilizing an Asch-type setting, found that under strong pressure conditions those subjects who had high scores on the Taylor Scale of Manifest Anxiety conformed less than subjects with low anxiety scores.

There apparently has not been a definitive investigation to resolve these conflicting findings.

However, in multivariate research data it must be noted that the variable of anxiety yields a positive discriminant weight in the expert pressure situation and that it yields a negative discriminant weight in the group pressure situations. This may well be the means to resolve conflicting results as noted in the literature previously, which is to say that the factor of anxiety has a positive predictive value in expert situations and that it has a negative predictive value in the group pressure situations.

Predictive Discriminant Weights
and Anxiety

E ₁ (n = 85)	E ₂ (n = 38)	G ₁ (n = 45)	G ₂ (n = 50)
.0964744	.0837088	-.0364962	-.0274398
\bar{X}6.5	\bar{X}5.9	\bar{X}6.6	\bar{X}6.0
S.D.....2.1	S.D.....2.2	S.D.....1.7	S.D.....1.9

(Standardization sten \bar{X} = 5.5)

The data indicate that those subjects who are conformers, regardless of the type pressure experienced, are, collectively, more anxious than not-conformers. These subjects, it may be noted, are also more anxious than the average college student as noted in Cattell's standardization sample. (Cattell, 1957)

Dogmatism

Previous multivariate research by Harvey (1963) resulted in the opinion that "conformity is a complex adjustment to both situational and personality factors."

In a simulated group situation, he found that the "high dogmatic" on the Rokeach Dogmatism Scale (1954) conformed more than did the "low dogmatic." Lefcourt (1962), in assessing readiness for therapy in narcotic addicts, found that those subjects considered to have the greatest "potential for change" had the lowest scores on the Rokeach Dogmatism Scale (1954).

In this research, it was found that the variable of dogmatism yields no discriminant weight in the expert pressure situation and that it does yield a discriminant weight in the group pressure situation. To that end, it may be hypothesized that dogmatism played no factor in the matter of predicting expert pressure response and that it is a predictive factor in group pressure situations.

Predictive Discriminant Weights
and Dogmatism

E_1 (n = 85)	E_2 (n = 38)	G_1 (n = 45)	G_2 (n = 50)
-0-	-0-	.0684519	.0641278
$\bar{X} = 24.2$	$\bar{X} = 23.2$	$\bar{X} = 23.5$	$\bar{X} = 23.2$
S.D. 4.2	S.D. 6.0	S.D. 3.7	S.D. 4.2
(Standardization $\bar{X} = 23$)			

Of the four groups, only the E_1 Ss indicate a slight tendency to be more dogmatic than an average S. Suffice it to say that dogmatism is efficacious as a predictor variable, nevertheless, but only in group pressure situations.

Rigidity

The personality dynamic identified as rigidity, which would indicate that the subject's personality is characterized by not-yielding and by not-conforming behaviors, has not been previously noted in the research literature. Examination of the data indicates that the variable does not yield a discriminant weight for any pressure type situation and that, in fact, the variable of rigidity may not be a predictive one. Hence, the variable was not utilized in Phase II research.

It may well be, however, that the validity and predictive efficiency of the instrument as utilized was insufficiently high to be of value in multivariate research. On the basis of the data obtained, however, it appears that rigidity, as a personality factor, is not a predictor variable in conformity research.

Acquiescence

The Couch-Kenniston Acquiescence Scale purports to assess the presence of an "agreeing response set." A high score is considered to be indicative of a high "agreeing response set," and a low score is to be equated with a low "agreeing response set," and a standardization \bar{X} of 33 is reported.

It is noted that, on the basis of the data, the variable of acquiescence is a predictor in each type conformity situation.

Predictive Discriminant Weights and Acquiescence

E_1 (n = 85)	E_2 (n = 38)	G_1 (n = 45)	G_2 (n = 50)
.0229030	.0215116	.0147106	.0172709
\bar{X}33.5	\bar{X}32.9	\bar{X}32.9	\bar{X}33.7
S.D.....5.5	S.D.....4.2	S.D.....5.1	S.D.....5.5
(Standardization \bar{X} = 33.0)			

Ego Strength

Smith (1961) found that one's ego strength was related to one's perceived competence and that those subjects with high ego strength yielded less under pressure. Weiner's (1958) results would seem to have corroborated this, for he found that those subjects with a high "certainty scale score" were more certain of their judgments and did not change their judgments as frequently as those subjects with a low "certainty scale score."

The data indicate that, in fact, the variable of ego strength yielded a discriminant weight only in the matter of group pressure situations and that it may well not be a predictor variable in expert pressure situations.

Predictive Discriminant Weights and Ego Strength

E_1 (n = 85)	E_2 (n = 38)	G_1 (n = 45)	G_2 (n = 50)
-0-	-0-	.0494433	.0436472
\bar{X}6.5	\bar{X}6.4	\bar{X}5.9	\bar{X}5.4
S.D.....2.4	S.D.....2.2	S.D.....2.3	S.D.....2.3

(Standardization sten $\bar{X} = 5.5$)

Confidence

Confidence, as assessed by the Saunders Self-Sufficiency Scale was obtained by utilizing the IPAT 16 P.F. Test, Form A (1957) with special permission of the author.

It was found that this variable yields a negative discriminant weight in the expert pressure situation and a positive discriminant weight in the group pressure situation. It may well be that high scores and "high confidence" is a predictor variable in group pressure situations and that low scores and "low confidence" are predictors in expert pressure situations.

Predictive Discriminant Weights and Confidence

E_1 (n = 85)	E_2 (n = 38)	G_1 (n = 45)	G_2 (n = 50)
-.0023913	-.0014989	.0349193	.0336275
\bar{X}33.5	\bar{X}11.8	\bar{X}12.9	\bar{X}12.3
S.D.....6.0	S.D.....6.6	S.D.....5.2	S.D.....7.0

(Standardization $\bar{X} = 33.5$)

Inspection of the data indicate that the group showing the lowest "confidence," E_2 , $\bar{X} = 32.8$, was a not-conforming group. These data appear to contradict the constructs upon which the test is predicated.

Extroversion/Introversion

The literature has previously not indicated the predictive value of the extroversion/introversion continuum. Analysis of the data indicates that, in fact, the variable does yield discriminant weights across all types of conformity situations.

Predictive Discriminant Weights and

Extroversion/Introversion			
E_1 (n = 85)	E_2 (n = 38)	G_1 (n = 45)	G_2 (n = 50)
.0159433	.0144541	.0379806	.0386756
\bar{X}13.1	\bar{X}11.8	\bar{X}12.9	\bar{X}12.3
S.D.....3.9	S.D.....3.8	S.D.....3.6	S.D.....4.2
(Standardization $\bar{X} = 13.1$, S.D. = 4.1)			

On the basis of these data, it appears that the group of subjects who did not conform to expert pressure are slightly more introverted than the group who conformed to expert pressure.

Both not-conforming groups were more introverted than the average subject.

Impulsivity

Impulsivity was assessed by the Barratt Impulsivity Scale and was used by special permission of the author. A high score on this test, with a range of 0 to 85, is said to indicate a high "impulsivity" and a low score is said to indicate a low "impulsivity." To that end, it is noted that the Barratt Impulsivity Scale yielded discriminant weights in the expert pressure situation only, with no discriminant weight being found predictive in the group pressure situation.

Predictive Discriminant Weights

and Impulsivity

E ₁ (n = 85)	E ₂ (n = 38)	G ₁ (n = 45)	G ₂ (n = 50)
.0122429	.0134652	-0-	-0-
\bar{X}28.3	\bar{X}27.9	\bar{X}28.4	\bar{X}28.5
S.D.....5.1	S.D.....5.0	S.D.....5.3	S.D.....5.2

It would appear that, as groups, all Ss demonstrated "low impulsivity."

Neuroticism

Neuroticism as a predictor variable has not been examined in isolation. Studies by Breger (1963), Hoffman (1953), and Mussen and Kagan (1958) have identified the central role of repressive ego defenses in conforming individuals. According to Breger (1963), "conformity is conceptualized as part of an ego defensive process centered around the repression of hostility," and he points to the usefulness of conceptualizing acquiescence in group pressure in terms which incorporate the portion of psychoanalytic theory concerned with the defensive process. The variable of neuroticism, as assessed by the Eysenck Personality Inventory, Form A, (1968) reveals a negative discriminant weight in the matter of expert pressure situations and no discriminant weight in group pressure situations.

Predictive Discriminant Weights and Neuroticism

E ₁ (n = 85)	E ₂ (n = 38)	G ₁ (n = 45)	G ₂ (n = 50)
-.0064478	-.0028945	-0-	-0-
\bar{X}12.1	\bar{X}9.9	\bar{X}11.4	\bar{X}10.9
S.D.....4.9	S.D.....4.5	S.D.....4.5	S.D.....5.4

(Standardization $\bar{X} = 10.9$, S.D. = 4.7)

On the basis of these data, those Ss who yield to expert pressure are more neurotic than the average person, while the not-conformer to expert pressure is less neurotic than the average person. All Ss who were conformers obtained higher than average neuroticism scores.

CHAPTER V

SUMMARY

A review of the literature relevant to researches concerning the phenomena of conformity behaviors yields the need for large sample, multivariate methodology, which will assess the pertinent variables contributing to "conforming to group pressure" and "conforming to expert pressure."

To that end, seventeen variables were utilized (birth order, chronological age, sex, race, IQ, socioeconomic status, geographic area of residence, religion, anxiety, dogmatism, rigidity, acquiescence, ego strength, confidence, extroversion/introversion, impulsivity, and neuroticism) to describe the behaviors of 104 subjects in a Tuddenham-type setting wherein the subjects were randomly assigned to either "Asch-type" (group pressure) or "Crutchfield-type" (expert pressure) treatment conditions.

Utilizing a stepwise multiple discriminant function analysis, discriminant weights were derived. The variable of rigidity was not found to be a valid predictor.

With the discriminant weights and the sixteen predictive second-order variables, 218 subjects were randomly assigned to treatment conditions and their "conforming" or "not-conforming" behaviors were predicted. The data of eleven subjects who correctly perceived the contrived nature of the experiment were not included.

Of the 123 subjects subjected to "expert pressure," 85 were not-conformers. Chi-Square analysis of the "expert pressure" data yields a significant difference at the .20 Level of Confidence. Of the 95 subjects subjected to "group pressure," 45 were conformers and 50 were not-conformers. Chi-Square was not significant.

Conformers to "expert pressure" were correctly identified 74 per cent of the time; conformers to "group pressure" were correctly identified 62 per cent of the time. Thus, it appears that conforming behaviors are predictable providing a multivariate method is used conjointly with a discriminant function analysis of the data.

The most difficult behavior to correctly predict is not-conforming to "expert pressure," with but 32 per cent correct. Too, but 40 per cent of the not-conforming to "group pressure" was correctly predicted.

Conformers to "expert pressure" were seen as typically being first-born, 20.8 year old Caucasian males or females with an IQ of 114. Their parents were high school graduates or above, and were either professional persons, business proprietors, or managers, et cetera. Their geographic area of residence was Rural East North Central United States, but this finding may be due to sampling error. Protestants were more frequently observed (n = 54) than Roman Catholics (n = 28). The conformers were slightly above average in anxiety and dogmatism. Average acquiescence,

ego strength, and confidence were noted. Low impulsivity was seen, and they were slightly extroverted. As a group, they were more neurotic than an average subject.

Not-conformers to "expert pressure" were seen as first-born 21.5 year old Caucasian males with an IQ of 119. No clear socioeconomic status was noted due to extreme scatter. The geographic area of residence was Rural East North Central United States. They were predominantly Protestant subjects.

They were less anxious than conformers, less dogmatic, and less acquiescent. They did not differ significantly in ego strength, confidence or impulsivity. However, they were more introverted and decidedly less neurotic than their conformer counterpart.

Conformers to "group pressure" were equally likely to be either a first or second-born 21 year old male or female Caucasian Protestant with an IQ of 116.

They were more anxious than an average subject. Dogmatism, acquiescence, ego strength, neuroticism, and extroversion/introversion were average. As a group, they were slightly more confident.

Subjects who were not-conformers to "group pressure" were seen as second-born 21.5 year old females with an IQ of 116. Two-thirds of these subjects were Protestant; one-third were Roman Catholic. No obvious socioeconomic status could be ascertained. They were less anxious than

conformers to "group pressure." No significant differences were noted in dogmatism, acquiescence, ego strength, confidence, impulsivity or extroversion/introversion. They were less neurotic than their conformer counterpart.

With an over-all correct prediction rate of but 56 per cent, however, it would appear that caution must indeed be utilized in assigning critical discriminatory properties to the various personality constellations. Further large sample multivariate research is indicated.

APPENDIX

EYSENCK PERSONALITY INVENTORY

FORM A

By H. J. Eysenck
and Sybil B. G. Eysenck

Name _____ Age _____ Sex _____

Grade or Occupation _____ Date _____

School or Firm _____ Marital Status _____

INSTRUCTIONS

Here are some questions regarding the way you behave, feel and act. After each question is a space for answering "Yes," or "No."

Try and decide whether "Yes," or "No" represents your usual way of acting or feeling. Then blacken in the space under the column headed "Yes" or "No."

Work quickly, and don't spend too much time over any question, we want your first reaction, not a long drawn out thought process. The whole questionnaire shouldn't take more than a few minutes. Be sure not to omit any questions. Now turn the page over and go ahead. Work quickly, and remember to answer every question. There are no right or wrong answers, and this isn't a test of intelligence or ability, but simply a measure of the way you behave.

|---|-----|----|---|--|-----|----|---|
| 1. Do you often long for excitement? | Yes | No | | 31. Do ideas run through your head so that you cannot sleep? | Yes | No | |
| 2. Do you often need understanding friends to cheer you up? | Yes | No | | 32. If there is something you want to know about, would you rather look it up in a book than talk to someone about it? | Yes | No | |
| 3. Are you usually carefree? | Yes | No | | 33. Do you get palpitations or thumping in your heart? | Yes | No | |
| 4. Do you find it very hard to take no for an answer? | Yes | No | | 34. Do you like the kind of work that you need to pay close attention to? | Yes | No | |
| 5. Do you stop and think things over before doing anything? | Yes | No | | 35. Do you get attacks of shaking or trembling? | Yes | No | |
| 6. If you say you will do something do you always keep your promise, no matter how inconvenient it might be to do so? | Yes | No | | 36. Would you always declare everything at the customs, even if you knew that you could never be found out? | Yes | No | |
| 7. Does your mood often go up and down? | Yes | No | | 37. Do you hate being with a crowd who play jokes on one another? | Yes | No | |
| 8. Do you generally do and say things quickly without stopping to think? | Yes | No | | 38. Are you an irritable person? | Yes | No | |
| 9. Do you ever feel "just miserable" for no good reason? | Yes | No | | 39. Do you like doing things in which you have to act quickly? | Yes | No | |
| 10. Would you do almost anything for a date? | Yes | No | | 40. Do you worry about awful things that might happen? | Yes | No | |
| 11. Do you suddenly feel shy when you want to talk to an attractive stranger? | Yes | No | | 41. Are you slow and unhurried in the way you move? | Yes | No | |
| 12. Once in a while do you lose your temper and get angry? | Yes | No | | 42. Have you ever been late for an appointment or work? | Yes | No | |
| 13. Do you often do things on the spur of the moment? | Yes | No | | 43. Do you have many nightmares? | Yes | No | |
| 14. Do you often worry about things you should not have done or said? | Yes | No | | 44. Do you like talking to people so much that you would never miss a chance of talking to a stranger? | Yes | No | |
| 15. Generally do you prefer reading to meeting people? | Yes | No | | 45. Are you troubled by aches and pains? | Yes | No | |
| 16. Are your feelings rather easily hurt? | Yes | No | | 46. Would you be very unhappy if you could not see lots of people most of the time? | Yes | No | |
| 17. Do you like going out a lot? | Yes | No | | 47. Would you call yourself a nervous person? | Yes | No | |
| 18. Do you occasionally have thoughts and ideas that you would not like other people to know about? | Yes | No | | 48. Of all the people you know are there some whom you definitely do not like? | Yes | No | |
| 19. Are you sometimes bubbling over with energy and sometimes very sluggish? | Yes | No | | 49. Would you say you were fairly self-confident? | Yes | No | |
| 20. Do you prefer to have few but special friends? | Yes | No | | 50. Are you easily hurt when people find fault with you or your work? | Yes | No | |
| 21. Do you daydream a lot? | Yes | No | | 51. Do you find it hard to really enjoy yourself at a lively party? | Yes | No | |
| 22. When people shout at you, do you shout back? | Yes | No | | 52. Are you troubled with feelings of inferiority? | Yes | No | |
| 23. Are you often troubled about feelings of guilt? | Yes | No | | 53. Can you easily get some life into a rather dull party? | Yes | No | |
| 24. Are all your habits good and desirable ones? | Yes | No | | 54. Do you sometimes talk about things you know nothing about? | Yes | No | |
| 25. Can you usually let yourself go and enjoy yourself a lot at a gay party? | Yes | No | | 55. Do you worry about your health? | Yes | No | |

PLEASE CHECK TO SEE THAT YOU HAVE ANSWERED ALL THE QUESTIONS.

COUGH FX SCALE

Circle T if you agree with the statement or circle F if you disagree. Answer each one.

ANSWERS

- T F 1. I often wish people would be more definite about things.
T F 2. It is annoying to listen to a lecturer who cannot seem to make up his mind as to what he really believes.
T F 3. I find that a well-ordered mode of life with regular hours is congenial to my temperament.
T F 4. It is hard for me to sympathize with someone who is always doubting and unsure about things.
T F 5. Our thinking would be a lot better off if we would just forget about words like "probably", "approximately", and "perhaps."
T F 6. I never make judgments about people until I am sure of the facts.
T F 7. A strong person will be able to take up his mind even on the most difficult questions.
T F 8. For most questions there is just one right answer, once a person is able to get all the facts.
T F 9. I like to have a place for everything and everything in its place.
T F 10. I don't like to work on a problem unless there is the possibility of coming out with a clear-cut and unambiguous answer.
T F 11. It bothers me when someone unexpected interrupts my daily routine.
T F 12. Most of the arguments or quarrels I get into are over matters of principle.
T F 13. I am known as a hard and steady worker.
T F 14. I don't like things to be uncertain and unpredictable.
T F 15. Once I have my mind made up I seldom change it.
T F 16. I think I am stricter about right and wrong than most people.
T F 17. I am in favor of a very strict enforcement of all laws, no matter what the consequences.
T F 18. I always see to it that my work is carefully planned and organized.
T F 19. The trouble with many people is that they don't take things seriously enough.
T F 20. I set high standards for myself and I feel others should do the same.
T F 21. People who seem unsure and uncertain about things make me feel uncomfortable.

WHAT TO DO: Inside this booklet are some questions to see what attitudes and interests you have. There are no "right" and "wrong" answers because everyone has the right to his own views. To be able to get the best advice from your results, you will want to answer them exactly and truly.

Write your name and other particulars at the top of your test sheet.

First, you should answer the four sample questions below so that you can see whether you need to ask anything before starting. Although you are to read the questions in this test, record also your answers at the side of your test sheet in the column designated "Answers". Circle the appropriate answer.

EXAMPLES:

- | | ANSWERS |
|--|-------------|
| 1. I like to watch team games. (a) yes, (b) occasionally, (c) no. | a
b
c |
| 2. I prefer people who: (a) are reserved, (b) (are) in between, (c) make friends easily. | a
b
c |
| 3. Money cannot bring happiness. (a) yes (true), (b) in between, (c) false. | a
b
c |
| 4. Woman is to child as cat is to: (a) kitten, (b) dog, (c) boy. | a
b
c |

In number four there is a right answer—kitten. But there are very few such reasoning items among the questions.

Ask any if anything is not clear. The examiner will tell you in a moment to turn the page and start.

When you answer, keep these four points in mind:

1. You are asked not to spend time pondering. Give the first, natural answer as it comes to you. Of course, the questions are too short to give you all the particulars you would sometimes like to have. For instance, the above question asks you about "team games" and you might be fonder of football than basketball. But you are to reply "for the average man," or to strike an average in situations of this kind stat.d. Give the best answer you can at a rate not slower than five or six a minute. You should finish in a short time.

TURN TO NEXT PAGE

2. Try **NOT** to fall back on the middle, "uncertain" answers except when the answer at either end is really **IMPOSSIBLE** for you—perhaps once every two or three questions.
3. Do sure not to skip anything, **BUT ANSWER EVERY QUESTION, SOMEHOW.** Some may not apply to you very well, but give your best guess. Some may seem personal; but remember that the answers are kept confidential and cannot be scored without a special stencil key. Answers to particular questions are not inspected.
4. Answer as honestly as possible what is true of **YOU.** Do not merely make what seems "the right thing to say," to impress the examiner.

DO NOT TURN THE PAGE UNTIL TOLD TO DO SO

ANSWERS

- 1. In constructing something I would rather work: (a) with a committee, (b) uncertain, (c) on my own. a
b
c
- 2. I find myself counting things, for no particular purpose: (a) often, (b) occasionally, (c) never. a
b
c
- 3. When talking I like: (a) to say things, just as they occur to me, (b) in between, (c) to get my thoughts well organized first. a
b
c
- 4. I never feel the urge to doodle and fidget when kept sitting, still at a meeting: (a) true, (b) uncertain, (c) false. a
b
c
- 5. As a teenager, I joined in school sports: (a) occasionally, (b) fairly often, (c) a great deal. a
b
c
- 6. I would rather step in the street to watch an artist painting than listen to some people having a quarrel. (a) true, (b) uncertain, (c) false. a
b
c
- 7. I sometimes get in a state of tension and turmoil as I think of the day's happenings. (a) Yes, (b) in between, (c) no a
b
c
- 8. I sometimes doubt whether people I am talking to are really interested in what I am saying. (a) Yes (b) in-between, (c) No a
b
c
- 9. I prefer to marry someone who can: (a) keep the family interested in its own activities, (b) in between, (c) make the family a part of the social life of the neighborhood. a
b
c
- 10. I would rather enjoy life quietly in my own way than be admired for my achievements. (a) true, (b) uncertain (c) false. a
b
c
- 11. I can work carefully on most things without being bothered by people making a lot of noise around me. (a) yes, (b) in between, (c) no. a
b
c
- 12. I feel that on one or two occasions recently I have been blamed more than I really deserve. (a) yes, (b) in between, (c) No. a
b
c

ANSWERS

- 13. I am always able to keep the expressions of my feelings under exact control. (a) yes, (b) in between, (c) no. a
b
c
- 14. At fifteen or sixteen I went about with the opposite sex. (a) a lot, (b) as much as most people, (c) less than most people a
b
c
- 15. I like to take an active part in social affairs, committee work, etc. (a) yes, (b) in between, (c) no. a
b
c
- 16. The idea that sickness comes as much from mental as physical causes is much exaggerated. (a) yes, (b) in between, (c) no. a
b
c
- 17. Quite small setbacks occasionally irritate me too much. (a) yes, (b) in between, (c) no. a
b
c
- 18. I very rarely blurt out annoying remarks that hurt people's feelings. (a) true, (b) uncertain, (c) false. a
b
c
- 19. It bothers me if people think I am being too unconventional or odd. (a) a lot, (b) somewhat, (c) not at all a
b
c
- 20. Most people would be happier if they lived more with their fellows and did the same things as others. (a) yes, (b) in between, (c) no a
b
c
- 21. I like to go my own way instead of acting on approved rules. (a) true, (b) uncertain, (c) false. a
b
c
- 22. Often I get angry with people too quickly. (a) yes, (b) in between, (c) No. a
b
c
- 23. When something upsets me, I generally calm again quite quickly. (a) yes, (b) in between, (c) no. a
b
c
- 24. I like to do my planning alone, without interruptions and suggestions from others. (a) yes, (b) in between, (c) no. a
b
c
- 25. I sometimes let my actions get swayed by feelings of jealousy. (a) yes, (b) in between, (c) no. a
b
c

ANSWERS

- | | |
|--|-------------|
| 25. I believe firmly "the boss may not always be right, but he always has the right to boss." (a) yes, (b) uncertain, (c) no. | a
b
c |
| 27. I tend to tremble or perspire when I think of a difficult task ahead. (a) generally, (b) occasionally, (c) never. | a
b
c |
| 28. If people shout suggestions when I'm playing a game, it does not upset me. (a) true, (b) uncertain, (c) false. | a
b
c |
| 29. I learn better by. (a) reading a well-written book, (b) in between, (c) joining a group discussion. | a
b
c |
| 30. I have periods when it's hard to stop a mood of self-pity. (a) often, (b) occasionally, (c) never. | a
b
c |
| 31. I like to wait till I am sure that when I am saying is correct, before I put forth an argument. (a) always, (b) generally, (c) only if it's practicable. | a

SYSTEMS SCALE

DIRECTIONS:

The following is a study of what the general public thinks and feels about a number of important social and personal questions. We have tried to cover many different and opposing points of view; you may find yourself agreeing strongly with some of the statements, disagreeing just as strongly with others, and perhaps uncertain about others; whether you agree or disagree with any statement, you can be sure that many people feel the same as you do.

Mark each statement in the left margin according to how much you agree or disagree with it. Please mark every one.

Write +1, +2, +3, or -1, -2, -3, depending on how you feel in each class.

- | | |
|----|-------------------------|
| +1 | I agree a little |
| +2 | I agree on the whole |
| +3 | I agree very much |
| -1 | I disagree a little |
| -2 | I disagree on the whole |
| -3 | I disagree very much |

MICHIGAN STATE UNIVERSITY EAST LANSING - MICHIGAN 48824

DEPARTMENT OF PSYCHOLOGY - OLD 11111

November 4, 1968

Dr. Charles L. Alcorn
Department of Psychology
McKendree College
Lebanon, Illinois 62254

Dear Dr. Alcorn:

You certainly have my permission to use the Dogmatism Scale for research purposes. All you have to do is mimeograph it yourself with the instructions from The Open and Closed Mind (New York: Basic Books, 404 Park Avenue South, New York, New York 10016). May I suggest, however, that you mix up the items well and, if possible, pad them with a few items from any other scale that you care to choose. It doesn't matter how you mix them up and it doesn't matter what items you use to pad them with.

I certainly hope that you will furnish me with a copy of the results of your research.

Sincerely yours,

Milton Rokeach

SYSTEMS SCALE

ANSWERS

ANSWERS

1. The United States and Russia have just about nothing in common.
2. Communism and Catholicism have nothing in common.
3. The principles I have come to believe in are quite different from those believed in by most people.
4. In a heated discussion people have a way of bringing up irrelevant issues rather than sticking to the main issue.
5. The highest form of government is a democracy and the highest form of a democracy is a government run by those who are most intelligent.
6. Even though freedom of speech for all groups is a worthwhile goal, it is unfortunately necessary to restrict the freedom of certain political groups.
7. While the use of force is wrong by and large, it is sometimes the only way possible to advance a noble ideal.
8. Even though I have a lot of faith in the intelligence and wisdom of the common man I must say that the masses behave stupidly at times.
9. It is only natural that a person would have a much better acquaintance with ideas he believes in than with ideas he opposes.
10. There are certain "isms" which are really the same even though those who believe in these "isms" try to tell you they are different.
11. Man on his own is a helpless and miserable creature.
12. Fundamentally, the world we live in is a pretty lonesome place.
13. Most people just don't give a "damn" for others.
14. I'd like it if I could find someone who would tell me how to solve my personal problems.
15. It is only natural for a person to be rather fearful of the future.
16. There is so much to be done and so little time to do it in.
17. Once I get wound up in a heated discussion I just can't stop.
18. In a discussion I often find it necessary to repeat myself several times to make sure I am being understood.
19. In a heated discussion I generally become so absorbed in what I am going to say that I forget to listen to what others are saying.
20. In a discussion I sometimes interrupt others too much in my eagerness to put across my own point of view.
21. It is better to be a dead hero than a live coward.
22. My hardest battles are with myself.
23. At times I think I am no good at all.
24. I am afraid of people who want to find out what I'm really like for fear they'll be disappointed in me.
25. While I don't like to admit this even to myself, my secret ambition is to become a great man, like Einstein, or Beethoven, or Shakespeare.
26. The main thing in life is for a person to want to do something important.
27. If given the chance I would do something of great benefit for the world.
28. If I had to choose between happiness and greatness, I'd choose greatness.
29. It's all too true that people just won't practice what they preach.
30. Most people are failures and it is the system which is responsible for this.
31. I have often felt that strangers were looking at me critically.
32. It is only natural for a person to have a guilty conscience.
33. People say insulting and vulgar things about me.
34. I am sure I am being talked about.
35. In the history of mankind there have probably been just a handful of really great thinkers.
36. There are a number of people I have come to hate because of the things they stand for.
37. A man who does not believe in some great cause has not really lived.
38. It is only when a person devotes himself to an ideal or cause that life becomes meaningful.

3

39. Of all the different philosophies which exist in this world there is probably only one which is correct.
40. A person who gets enthusiastic about too many causes is likely to be a pretty "wishy-washy" sort of person.
41. To compromise with our political opponents is dangerous because it usually leads to the betrayal of our own side.
42. When it comes to differences of opinion in religion we must be careful not to compromise with those who believe differently from the way we do.
43. In times like these, a person must be pretty selfish if he considers primarily his own happiness.
44. To compromise with our political opponents is to be guilty of appeasement.
45. The worst crime a person could commit is to attack publicly the people who believe in the same thing he does.
46. In times like these it is often necessary to be more on guard against ideas put out by people or groups in one's own camp than by those in the opposing camp.
47. A group which tolerates too much differences of opinion among its own members cannot exist for long.
48. There are two kinds of people in this world: those who are for the truth and those who are against the truth.
49. My blood boils whenever a person stubbornly refuses to admit he's wrong.
50. A person who thinks primarily of his own happiness is beneath contempt.
51. Most of the ideas which get printed nowadays aren't worth the paper they are printed on.
52. I sometimes have a tendency to be too critical of the ideas of others.
53. In this complicated world of ours the only way we can know what's going on is to rely on leaders or experts who can be trusted.
54. It is often desirable to reserve judgment about what's going on until one has had a chance to hear the opinions of these one respects.
55. In the long run the best way to live is to pick friends and associates whose tastes and beliefs are the same as one's own.

ANSWERS

56. There's no use wasting your money on newspapers which you know in advance are just plain propaganda.
57. Young people should not have easy access to books which are likely to confuse them.
58. The present is all too often full of unhappiness. It is only the future that counts.
59. It is by returning to our glorious and forgotten past that real social progress can be achieved.
60. To achieve the happiness of mankind in the future it is sometimes necessary to put up with injustices in the present.

RESPONSE SET

Read the statement and decide whether or not it is true as it applies to you. In the left hand column mark True or False for each statement.

- | True | False | |
|--------------------------|--------------------------|--|
| <input type="checkbox"/> | <input type="checkbox"/> | 1. There are days when one awakes from sleep without a care in the world, full of zest and eagerness for whatever lies ahead of him. |
| <input type="checkbox"/> | <input type="checkbox"/> | 2. Beneath the polite and smiling surface of man's nature is a bottomless pit of evil. |
| <input type="checkbox"/> | <input type="checkbox"/> | 3. The real substance of life consists of a procession of disillusionments, with but few goals that are worth the effort spent in reaching them. |
| <input type="checkbox"/> | <input type="checkbox"/> | 4. You will certainly be left behind if you stop too often or too long to give a helping hand to other people. |
| <input type="checkbox"/> | <input type="checkbox"/> | 5. Most satisfying is the knowledge that one is an indispensable and appreciated member of a purposeful and effective group (team or institution). |
| <input type="checkbox"/> | <input type="checkbox"/> | 6. Very few people can be trusted. |
| <input type="checkbox"/> | <input type="checkbox"/> | 7. If a man is to fulfill his destiny he can expend <u>no more than a small fraction</u> of his supply of energy in the service of others. |
| <input type="checkbox"/> | <input type="checkbox"/> | 8. The prospect is pretty hopeless: it looks as if the Nations were heading for their doom—no final, far-fel, accidental, global war. |
| <input type="checkbox"/> | <input type="checkbox"/> | 9. The world is teeming with opportunities and promises of success for anyone with sufficient imagination to perceive them. |
| <input type="checkbox"/> | <input type="checkbox"/> | 10. There is little chance of ever finding real happiness. |
| <input type="checkbox"/> | <input type="checkbox"/> | 11. The vast majority of men are truthful and dependable. |
| <input type="checkbox"/> | <input type="checkbox"/> | 12. There are always plenty of people who are eager to extend a helping hand. |
| <input type="checkbox"/> | <input type="checkbox"/> | 13. Nice as it may be to have faith in the majority of your fellowmen, it does not pay off. |
| <input type="checkbox"/> | <input type="checkbox"/> | 14. If you have faith in your friends, they will seldom disappoint you. |
| <input type="checkbox"/> | <input type="checkbox"/> | 15. In this era of spies and counter-spies, accusations and counter-accusations, a man should keep his feelings and opinions strictly to himself. |
| <input type="checkbox"/> | <input type="checkbox"/> | 16. The future looks black as pitch, with little in view to justify a core of hope or faith. |
| <input type="checkbox"/> | <input type="checkbox"/> | 17. The way to get the most out of life is to seize every opportunity to enjoy it. |
| <input type="checkbox"/> | <input type="checkbox"/> | 18. Most people you meet are friendly and obliging, more disposed to aid you than to refuse aid. |
| <input type="checkbox"/> | <input type="checkbox"/> | 19. For anyone with an average amount of energy, self-confidence and talent the chances of success in life are excellent. |
| <input type="checkbox"/> | <input type="checkbox"/> | 20. You can be certain that beyond every obstacle you encounter your chosen path is flanked by a succession of further obstacles—some of which are insurmountable. |

- | True | False | |
|--------------------------|--------------------------|--|
| <input type="checkbox"/> | <input type="checkbox"/> | 21. Every person should have complete faith in some supernatural power whose decisions he obeys without question. |
| <input type="checkbox"/> | <input type="checkbox"/> | 22. Christianity and all other religions are, at best, only partly true. |
| <input type="checkbox"/> | <input type="checkbox"/> | 23. A man should be his own harshest judge. |
| <input type="checkbox"/> | <input type="checkbox"/> | 24. All development of personality begins with a frank admission of one's deficiencies and limitations. |
| <input type="checkbox"/> | <input type="checkbox"/> | 25. Shower your friends with gifts; that is the way to a full life. |
| <input type="checkbox"/> | <input type="checkbox"/> | 26. The first law is: know and accept thyself without distortions or equivocations. |
| <input type="checkbox"/> | <input type="checkbox"/> | 27. There's no desire that cannot at least be considered. |
| <input type="checkbox"/> | <input type="checkbox"/> | 28. A beneficent Being watches over us and protects us from harm. |
| <input type="checkbox"/> | <input type="checkbox"/> | 29. Don't encourage fears and anxieties by dwelling on them. |
| <input type="checkbox"/> | <input type="checkbox"/> | 30. The only reason for being "nerdy" is that you usually get caught if you aren't. |
| <input type="checkbox"/> | <input type="checkbox"/> | 31. Questions of "right" and "wrong" seldom concern me. |
| <input type="checkbox"/> | <input type="checkbox"/> | 32. Modern literature is overly introspective, personal, and subjective. |
| <input type="checkbox"/> | <input type="checkbox"/> | 33. Time is money—only the man who can save will ever sit in the seats of the mighty. |
| <input type="checkbox"/> | <input type="checkbox"/> | 34. I like advice before making decisions. |
| <input type="checkbox"/> | <input type="checkbox"/> | 35. I seldom read the advice of others about anything. |
| <input type="checkbox"/> | <input type="checkbox"/> | 36. It has always been hard for me to get used to new places. |
| <input type="checkbox"/> | <input type="checkbox"/> | 37. I often get into extremely difficult positions with people in authority. |
| <input type="checkbox"/> | <input type="checkbox"/> | 38. I get along well with people. |
| <input type="checkbox"/> | <input type="checkbox"/> | 39. I couldn't care less what others think of me. |
| <input type="checkbox"/> | <input type="checkbox"/> | 40. I need neither help nor praise nor sympathy. |
| <input type="checkbox"/> | <input type="checkbox"/> | 41. Most human relationships reduce, in the last analysis, to a question of who is going to be boss and who is going to obey. |
| <input type="checkbox"/> | <input type="checkbox"/> | 42. My study habits are rather erratic. |
| <input type="checkbox"/> | <input type="checkbox"/> | 43. I ask for nothing and expect less. |
| <input type="checkbox"/> | <input type="checkbox"/> | 44. I've had a number of different ideas about what I will eventually become. |
| <input type="checkbox"/> | <input type="checkbox"/> | 45. I seldom look at my watch. |
| <input type="checkbox"/> | <input type="checkbox"/> | 46. I can always reread certain passages in books or poems with enjoyment. |
| <input type="checkbox"/> | <input type="checkbox"/> | 47. I cannot escape the conviction that fate somehow has it in for me. |
| <input type="checkbox"/> | <input type="checkbox"/> | 48. I respond to a work of art with my feelings, not with my intellect. |
| <input type="checkbox"/> | <input type="checkbox"/> | 49. I like nothing better than having breakfast in bed. |
| <input type="checkbox"/> | <input type="checkbox"/> | 50. I persist in the face of difficulties. |
| <input type="checkbox"/> | <input type="checkbox"/> | 51. I eagerly take in all that goes on around me. |
| <input type="checkbox"/> | <input type="checkbox"/> | 52. No one is of great emotional importance to me. |
| <input type="checkbox"/> | <input type="checkbox"/> | 53. I like to think things out ahead of time. |
| <input type="checkbox"/> | <input type="checkbox"/> | 54. All life is to be seized upon and made part of oneself. |
| <input type="checkbox"/> | <input type="checkbox"/> | 55. I am very sensitive to criticism. |
| <input type="checkbox"/> | <input type="checkbox"/> | 56. I am afraid if I had money I couldn't get it back. |
| <input type="checkbox"/> | <input type="checkbox"/> | 57. I prefer work that can be done—finished and put away—to work that stretches out over a long time. |
| <input type="checkbox"/> | <input type="checkbox"/> | 58. Most people are pretty cold. |
| <input type="checkbox"/> | <input type="checkbox"/> | 59. I sometimes feel that I'm the plaything of forces beyond my control. |
| <input type="checkbox"/> | <input type="checkbox"/> | 60. Man's state is one of isolation—there is no possibility of genuine communication with others. |
| <input type="checkbox"/> | <input type="checkbox"/> | 61. Most unhappy people could improve their lot if they only tried. |
| <input type="checkbox"/> | <input type="checkbox"/> | 62. Most people are not nearly as efficient as they could be if they were trained to use all of their time. |
| <input type="checkbox"/> | <input type="checkbox"/> | 63. It is always to be born, pain to live, grief to die. |
| <input type="checkbox"/> | <input type="checkbox"/> | 64. I feel that most people like me. |
| <input type="checkbox"/> | <input type="checkbox"/> | 65. Happiness is one of the primary goals of life. |
| <input type="checkbox"/> | <input type="checkbox"/> | 66. I can be pretty realistic at times. |
| <input type="checkbox"/> | <input type="checkbox"/> | 67. I am continually trying to integrate my inner values, impulses, and experiences with the demands of external reality. Hope only brings disappointment. |
| <input type="checkbox"/> | <input type="checkbox"/> | 68. Hope only brings disappointment. |
| <input type="checkbox"/> | <input type="checkbox"/> | 69. I get annoyed at people who take a long time to get to the point. |
| <input type="checkbox"/> | <input type="checkbox"/> | 70. I usually think of what I should have said long after the time to say it has passed. |

PERSONAL PREFERENCES NO. 2

This inventory measures personal preferences or opinions. There are no right and wrong answers. You merely indicate whether each statement is true or false as it applies to you. If a statement is true, mark the space in the "T" column; if a statement is false, mark the space in the "F" column. Remember, the answers should indicate your preferences or opinions. Since the statements reflect clear-cut preferences, you will be able to respond to each statement quickly. Do not linger over any statement.

If you have questions, ask them before you start indicating your preferences.

Mark only on the answer sheet.

1. I'm scared of spiders.
2. I hate people.
3. I like to take a chance just for the excitement.
4. In the morning I usually bound out of bed energetically.
5. People like me.
6. I go to church often.
7. I read at least three novels a year.
8. I spend little of my leisure time out of doors.
9. I usually think before I act.
10. I like mathematics.
11. I answer questions quickly.
12. I enjoy children.
13. I like to work crossword puzzles.
14. I like classical music.
15. I often change my plans.
16. I like to walk on grass in my bare feet.
17. I like detailed work.
18. My health is good.
19. I am very religious.
20. I make up my mind quickly.
21. As a youngster I rarely took part in risky stunts.
22. I seldom forget things.
23. It's always tense.
24. I like to solve complex problems.
25. I love my father.
26. I let myself "go" at a party.
27. I consider myself always careful.
28. I change my plans often.
29. I like crowds of people.
30. People exp. at too much of me.
31. I often make people laugh.
32. I like prompt people.
33. I usually notice the furniture arrangements in a strange house.
34. I seldom have a ready answer.
35. I like rainy weather.
36. Tying on clothes always no.
37. Bags both no.
38. I don't like to wait for traffic lights to change.
39. I frequently feel on "top of the world."
40. I have many nose bleeds.
41. I dream in technicolor.
42. I like red-heads.
43. I like work requiring patience and carefulness.
44. Tuesday is my best day.
45. Bright lights bother me.
46. I like work involving competition.
47. I have difficulty remembering names of people.
48. I easily become impatient with people.
49. I like horror movies.
50. Green is my favorite color.
51. In watching games, I often yell along with the others.
52. I don't like having my plans changed.
53. I like to work with slow people.
54. I don't like to eat outdoors.
55. I don't enjoy meeting relatives at family reunions.
56. I'm always on time for social events.
57. I make up my mind easily.
58. I'd like to own a sports car.
59. I don't like to dress up for formal occasions.
60. I like work in which I must change often from one task to another.
61. I keep a diary regularly.
62. I scan newspapers rather than read them carefully.
63. I like work that has lots of excitement.
64. I'm a chain smoker.
65. I find it hard to keep friends.
66. I attend basketball games regularly.
67. I like new situations.
68. It is easy for me to concentrate on my work.
69. When I see a train or plane I wish I were on it.
70. I like to play chess.
71. Laws are absolute.
72. My interests tend to change quickly.
73. I like to solve problems than read a story.
74. The color red reminds me of blood.
75. I like to do things on the spur of the moment.
76. People are after me.
77. I don't like changes.
78. My friends consider me to be happy-go-lucky.
79. I prefer a play to going to an amusement park.
80. I don't like to ride in elevators.
81. I like a great deal of variety in my work.
82. I prefer modern furniture to traditional.
83. My skin itches when I have to speak in public.
84. I like being where there is something going on all the time.
85. I like to watch fires.

N..F. _____ AGE _____

D..TE _____ SEX _____

THE UNIVERSITY OF TEXAS MEDICAL BRANCH
GALVESTON, TEXAS 77550

December 2, 1968

Mr. Charles L. Alcorn
Dept. of Psychology
McKendree College
Lebanon, Illinois 62254

Dear Mr. Alcorn:

I am enclosing a copy of the BIS and a key (26 or 50 items). The two scales are highly correlated. I have found that the 50 item scale tends to be a little more stable over long time periods. I would be pleased to receive the results of the use of the scale and any other material you may have related to impulsiveness.

Sincerely yours,

A handwritten signature in cursive script, appearing to read "Ernest S. Barratt".

Ernest S. Barratt, Ph.D.
Research Professor, and
Director, Behavioral Science Lab.
Dept. of Neurology and Psychiatry

ESB:slr

SELF FORM

Name _____ Age _____ Sex _____

This form contains forty questions, dealing with difficulties that most people experience at one time or another. It will help a lot in self-understanding if you check Yes, No, etc., to each, frankly and truthfully, to describe any problems you may have.

1. I find that my interests, in people and amusements, tend to change fairly rapidly. True In between False
2. If people think poorly of me I can still go on quite serenely in my own mind. True In between False
3. I like to wait till I am sure that what I am saying is correct, before I put forward an argument. Yes In between No
4. I am inclined to let my actions get swayed by feelings of jealousy. Sometimes Seldom Never
5. If I had my life to live over again I would: (a) plan very differently, (b) want it the same. A In between B
6. I admire my parents in all important matters. Yes In between No
7. I find it hard to "take 'no' for an answer", even when I know what I ask is impossible. True In between False
8. I doubt the honesty of people who are more friendly than I would naturally expect them to be. True In between False
9. In demanding and enforcing obedience my parents (or guardians) were: (A) always very reasonable, (B) often unreasonable. A In between B
10. I need my friends more than they seem to need me. Rarely Sometimes Often
11. I feel sure that I could "pull myself together" to deal with an emergency. Always Often Seldom Never
12. As a child I was afraid of the dark. Often Sometimes
13. People can tell me that I show my excitement in voice and manner too obviously. Yes Uncertain No
14. If people take advantage of my friendliness I: (A) soon forget and forgive, (B) resent it and hold it against them. A In between B
15. I find myself upset rather than helped by the kind of personal criticism that many people make. Often Occasionally Never
16. Often I get angry with people too quickly. True In between False
17. I feel restless as if I want something but do not know what. Very Rarely Sometimes Often
18. I sometimes doubt whether people I am talking to are really interested in what I am saying. True In between False
19. I have always been free from any vague feelings of ill-health, such as obscure pains, digestive upsets, nervousness of heart action, etc. True In between False
20. In discussion with some people, I get so annoyed that I can hardly trust myself to speak. Sometimes Rarely Never
21. Through getting tense I use up more energy than most people in getting things done. True Uncertain False
22. I take a point of not being absent-minded or forgetful of details. True Uncertain False
23. However difficult and unpleasant the obstacles, I always stick to my original intentions. Yes In between No
24. I tend to get over-excited and "rattled" in upsetting situations. Yes In between No
25. I occasionally have vivid dreams that disturb my sleep. Yes In between No
26. I always have enough energy when faced with difficulties. Yes In between No
27. I sometimes feel compelled to count things for no particular purpose. True Uncertain False
28. Most people are a little queer mentally, though they do not like to admit it. True Uncertain False
29. If I make an awkward social mistake I can soon forget it. Yes In between No
30. I feel grouchy and just do not want to see people: (A) occasionally, (B) rather often. A In between B
31. I am brought almost to tears by having things go wrong. Never Very rarely Sometimes
32. In the midst of social groups I am nevertheless sometimes overcome by feelings of loneliness and worthlessness. Yes In between No

Self Form
Page 2

33. I wake in the night and, through worry, have some difficulty in sleeping again. Often Sometimes Never
34. My spirits generally stay high no matter how many troubles I meet. Yes In between No
35. I sometimes get feelings of guilt or remorse over quite small matters. Yes In between No
36. My nerves get on edge so that certain sounds, e.g., a squeaky hinge, are unbearable and give me the shivers. Often Sometimes Never
37. If something badly upsets me I generally calm down again quite quickly. True Uncertain False
38. I tend to tremble or perspire when I think of a difficult task ahead. Yes In between No
39. I usually fall asleep quickly, in a few minutes, when I go to bed. Yes In between No
40. I sometimes get in a state of tension or turmoil as I think over my recent concerns and interests. True Uncertain False

Multiple Discriminant Analysis 269

writing the computational sequence. For each group of subjects, the matrices P , T , and W are formed in turn from the raw scores (X) by the following methods:

$$P^{uv} = X^{uv} X^{uv}$$

$$T^{uv} = X^{uv} C^v$$

$$W^{uv} = P^{uv} - T^{uv} T^{uv} N^{-1}$$

where N = the number of subjects in the group

M = the number of variables

These matrices and the total N are accumulated over all groups and the following matrices are developed from them: P , T , W , and N hereafter refer to the accumulated matrices.

$$C^{uv} = N^{-1} (P^{uv} - T^{uv} T^{uv} N^{-1})$$

$$A^{uv} = N C^{uv} - W^{uv}$$

Although W and A are symmetric matrices, their product is not. The discriminant functions are the eigenvectors of this product matrix $W^{-1}A$, and cannot be extracted with Subroutine S1 (X). A subroutine for extracting the roots and vectors of a square by symmetric matrix follows.

AFSINZY, NI, C(A, V, E, X, Y, Z, NDI)

A subroutine to extract roots and vectors from a square symmetric matrix.

This subroutine is organized very much like Subroutine SEVS, except that both "right" and "left" eigenvectors are extracted and their outer product is used to deflate the A matrix after extraction of each root. The right (column) vectors are returned by the routine in denormalized form as columns of matrix X . The vector E is returned holding the corresponding roots which are the sums of squares of these column vectors. The deflation technique used here is described by White (1978). It is worth noting that the input matrix A is symmetric, the right and left vectors are identical and the computational formulas may be reduced to those of Subroutine M1 (X).

An arbitrary limit of 25 iterations has been imposed on the extraction of each root, which yields more than enough accuracy for most problems in the behavioral sciences (figure 10-51).

This statistical technique may be conceptualized as an extension of single-classification analysis of variance to include simultaneously a group of dependent variables. The problem is to determine the extent and manner in which two or more previously defined groups of subjects may be differentiated by a set of dependent variables operating together. With two groups of subjects this separation can be represented only along a single dimension, but with more than two groups the differentiation may be described in terms of multiple independent dimensions. The *minimum* number of these factors or reference axes necessary to represent a group of differences will be the number of groups minus one, or the number of variables, whichever is smaller.

The procedure used in Program DISR1 is based on the work of Cooley and Lohnes (1962), although certain minor modifications have been made. The direct factoring of $W^{-1}A$ and the internal computation of correlations between original variables and discriminant functions are the responsibility of the author.

The notation of matrix algebra is the most convenient vehicle for de-

An intuitive approach to understanding the discriminant analysis procedure is suggested by interpreting the $W^{-1}A$ matrix as analogous to an F ratio in single-classification analysis of variance; F is the ratio of terms representing within-group and among-group variation also. If the F ratio can be considered an index of the ability of a dependent variable to discriminate (separate) the predetermined groups of subjects, then the factoring of the $W^{-1}A$ matrix may be construed as the partitioning of the discriminating power of the set of dependent variables into independent components, which may perhaps lead to or support hypotheses about underlying sources of the variation among the groups.

The vectors obtained from $W^{-1}A$ by Subroutine AEVS are also analogous to factor dimensions in that they are independent axes defining a K-fold space. The nature of this space, however, is such that when points representing the groups are located within it, these points are separated from each other to a maximum degree. Points representing each individual

FIGURE 10-5. Subroutine AEVS flow chart.

subject in the sample may also be located within this space. In order to obtain the coordinates for these points, the vectors returned by Subroutine AEVS are normalized and the resulting eigenvectors of $W^{-1}A$ are then multiplied directly by each subject's vector of raw scores on the original variables to obtain a set of discriminant scores. We will use the letter K to indicate the number of discriminant axes and also the number of discriminant scores per subject. The vectors returned by Subroutine AEVS are normalized by:

$$B_{iK} = V_{iK} E_{iK}^{-1/2}$$

Discriminant scores for all subjects are represented by:

$$D_{iK} = X_{i0} B_{iK}$$

Just as individual subjects may be located by sets of discriminant scores,

so also may groups be located at their centroids in the discriminant space. The coordinates of these centroids or multivariate means are computed from a matrix H containing the means of each of the L groups on each of the M original variables, using the same eigenvectors:

$$C_{1a} = H_1^{-1} H_{1a}$$

The coefficients contained in the eigenvectors of $W^{-1}A$ do not necessarily reflect the relationships between the original variables and the discriminant function variables. To compute correlations between these two sets of dimensions in order to determine the "nature" of the discriminant function, we could obtain discriminant scores for all subjects and directly compute the correlations we seek. It is more economical from a program-ming standpoint, however, to use the covariance matrix C as a basis for accomplishing this by the following method:

$$S_{1a} = C_{1a}^{-1} Q_{1a} \quad (\text{sigmas of the original variables})$$

$$Q_{1a} = (H_{1a}^{-1} C_{1a}^{-1} H_{1a})^{-1} Q_{1a} \quad (\text{sigmas of the discriminant variables})$$

$$R_{1a} = S_{1a}^{-1} C_{1a}^{-1} H_{1a}^{-1} Q_{1a} \quad (\text{sigmas of the discriminant axes, Wilks' Lambda is defined by})$$

These correlation coefficients may be interpreted in much the same way as factor loadings, to describe the discriminant dimensions in terms of the range of the original variables.

Although the maximum number of discriminant axes (K) are obtained from Subroutine AEXS and are used in all of the previously described computations, they will be successively less important in that they will account for successively less of the differences among the predicted groups of subjects on the original dimensions. A statistical test is available to determine the extent to which the discrimination of the groups obtained would be likely by chance alone, as well as tests for the significance of group separation along each of the discriminant axes. Wilks' Lambda is defined by

$$\Lambda = \frac{|H|}{|H| + |W|}$$

where the symbol H means the product of all K terms, and is tested with an F ratio (Coxley and Jones, 1962, p. 125) which indicates the significance of overall group differentiation. C the square tests of the significance of each discriminant function are computed from formulas derived from Rao (1952, p. 273).

When only one discriminant dimension is significant, subject scores and group centroids can be adequately represented at points on a single linear dimension scaled in terms of the discriminant scores. When two functions are significant, a two-dimensional plot (graph) is required, as illustrated in Figure 10-6, where we have plotted the subject points and group centroids for the example problem. The discrimination effected here is artificial.

After obtaining parameters and the data-card format from the (CDS) Subroutine, the C and W matrices are zeroed, since they withhold raw and deviation cross-products accumulated over groups. As each group of subjects is input from data cards punched in the usual manner, raw scores for variables across each subject's cards, the sum of scores on each variable is stored in matrix B and a within-group matrix is computed and added to W . Raw cross-products are added to matrix C . Row sums of squares are saved in C for the later univariate analyses, and the covariance among and within-group matrices are computed. $W^{-1}A$ is computed next and submitted to Subroutine AEXS. Discriminant score weights are computed and output, followed by computation of correlations between original variables and discriminant functions.

Wilks' Lambda is computed and tested for significance, followed by the chi-square tests of each discriminant function. Group centroids are computed next, and then univariate analyses of variance are computed for each

PROGRAM ORGANIZATION

Programs because the grouping of subjects which clusters subjects so as to maximize group differences.

FIGURE 10-6. Group centroids and subject point for example problem

274 ANALYSIS OF VARIANCE

of the original variables for comparison purposes. Finally, discriminant scores are computed for each subject, if optioned (Figure 10-7).

EXAMPLE PROBLEM

This example problem is artificial in that the subjects have been clustered by an analytic routine (Program HGROUP) which maximizes group differ-

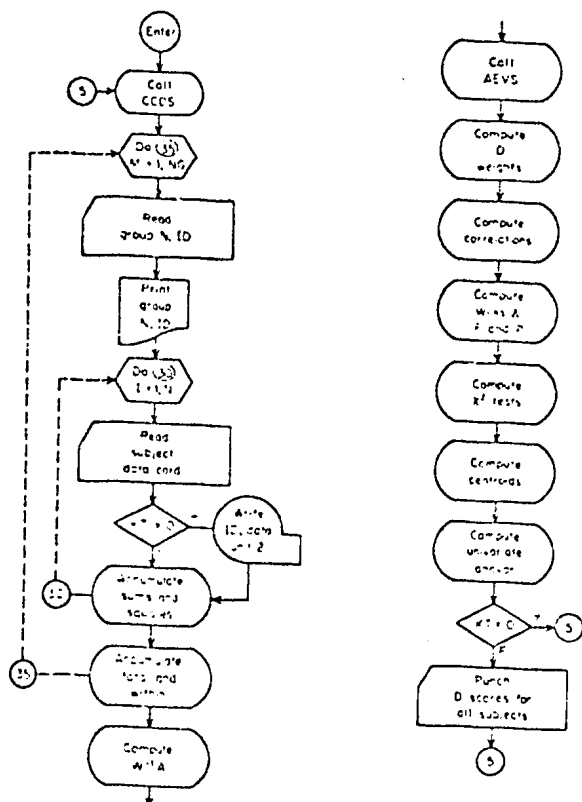

FIGURE 10-7. Program DSCRIM flow chart.

Example Problem 275

ences. Most of the subjects compose group B, while two other groups of relatively deviant score-profile types are composed of only two and three subjects respectively. Both of the discriminant functions yield significant chi-square values. Most of the variables load the first discriminant axis, while the second discriminant function appears to be determined largely by variable five. Inspection of the results of the univariate analyses indicates that variables six, seven, and eight do not by themselves separate the groups. Their contributions to the composite discriminant functions, on the other hand, are indicated by their weights in the vectors used to compute the discriminant scores (punched output listing), as well as by their correlations with the discriminant-function variables (printed output).

We want to sample your opinions. Please signal your answer as the Laboratory Assistant requests.

1. How long has the average American man-and-wife been married?
 1. One year
 2. Two to three years
 3. Four to five years
 4. Six to eight years
 5. Nine to ten years
 6. Eleven to twelve years
 7. Thirteen to fifteen years
 8. Sixteen to nineteen years
 9. Over 20 years
2. What is the current national debt?
 1. \$1,000,000
 2. \$10,000,000
 3. \$18,000,000
 4. \$180,000,000
 5. \$1,800,000,000
 6. \$50,000,000
 7. \$500,000,000
 8. \$1,500,000,000
 9. \$1,500,000
3. How old is the typical college senior upon graduation?
 1. 17 years old
 2. 18 years old
 3. 19 years old
 4. 20 years old
 5. 21 years old
 6. 22 years old
 7. 23 years old
 8. 24 years old
 9. None of these
4. How many children does the average family have?
 1. One-half
 2. One
 3. One-and-a-half
 4. Two
 5. Two-and-a-half
 6. Three
 7. Three-and-a-half
 8. Four
 9. None
5. What does the typical housewife weigh?
 1. 80 lbs
 2. 85 lbs
 3. 90 lbs
 4. 95 lbs
 5. 100 lbs
 6. 110 lbs
 7. 125 lbs
 8. 140 lbs
 9. 150 lbs
6. What is the median family income?
 1. \$1000
 2. \$2000
 3. \$3000
 4. \$4000
 5. \$5000
 6. \$6000
 7. \$7000
 8. \$8000
 9. \$9000
7. What is the average yearly rainfall in Death Valley?
 1. None
 2. Less than a half-inch
 3. One inch
 4. An inch and a half
 5. Two inches
 6. Three inches
 7. Four inches
 8. Five inches
 9. Six inches
8. How many passenger automobiles are operating today?
 1. 1,000,000
 2. 2,000,000
 3. 3,500,000
 4. 4,500,000
 5. 6,000,000
 6. 7,500,000
 7. 9,500,000
 8. 10,000,000
 9. None of these
9. How long is a typical engagement before marriage?
 1. One month
 2. Six weeks
 3. Three months
 4. Four months
 5. Six months
 6. Nine months
 7. One year
 8. Two years
 9. Three years
10. What does a typical newborn baby girl weigh?
 1. 4lbs
 2. 4lbs 6oz.
 3. 4lbs 9oz.
 4. 5lbs
 5. 5lbs 3oz.
 6. 5 1/2lbs
 7. 6lbs
 8. 6 1/2lbs
 9. 7lbs
11. How many pennies in a pound?
 1. 10
 2. 20
 3. 30
 4. 40
 5. 50
 6. 60
 7. 70
 8. 80
 9. 90
12. How many freckles does the typical red-haired boy have?
 1. 10
 2. 20
 3. 30
 4. 40
 5. 50
 6. 500
 7. 600
 8. 700
 9. 800
13. What is the average high tide in Baltimore, Md.?
 1. 1 foot
 2. 2 feet
 3. 4 feet
 4. 5 feet
 5. 6 feet
 6. 7 feet
 7. 8 feet
 8. 9 feet
 9. None of these

14. How far is it from Atlanta, Georgia to Seattle, Washington?

- | | |
|----------------|------------------|
| 1. 1,000 miles | 6. 3,500 miles |
| 2. 1,500 miles | 7. 4,000 miles |
| 3. 2,000 miles | 8. 4,500 miles |
| 4. 2,500 miles | 9. None of these |
| 5. 3,000 miles | |

15. How many boys does a typical girl date before marriage?

- | | |
|----------|------------------|
| 1. Two | 6. Eight |
| 2. Four | 7. Ten |
| 3. Five | 8. Twenty |
| 4. Six | 9. None of These |
| 5. Seven | |

16. How old is a typical family car?

- | | |
|---------------------------|------------------|
| 1. One year | 6. Four years |
| 2. Two years | 7. Five years |
| 3. Two-and-a-half years | 8. Six years |
| 4. Three years | 9. None of these |
| 5. Three-and-a-half years | |

17. How many grandchildren on "one side" of a typical family?

- | | |
|----------|----------|
| 1. One | 6. Six |
| 2. Two | 7. Seven |
| 3. Three | 8. Eight |
| 4. Four | 9. Nine |
| 5. Five | |

18. What is the average weekly allowance for high school sophomores?

- | | |
|-----------|----------------|
| 1. 50¢ | 6. \$3.00 |
| 2. 75¢ | 7. \$3.50 |
| 3. \$1.50 | 8. \$4.00 |
| 4. \$2.00 | 9. Over \$5.00 |
| 5. \$2.50 | |

19. How many fish in an average 5 acre lake?

- | | |
|----------|------------------|
| 1. 1,000 | 6. 6,000 |
| 2. 2,000 | 7. 7,000 |
| 3. 3,000 | 8. 8,000 |
| 4. 4,000 | 9. None of these |
| 5. 5,000 | |

20. What is the average grade-point-average four point scale for college juniors?

- | | |
|---------|---------|
| 1. 2.0 | 6. 2.75 |
| 2. 2.05 | 7. 3.0 |
| 3. 2.15 | 8. 3.5 |
| 4. 2.25 | 9. 4.0 |
| 5. 2.5 | |

21. How many countries belong to the U. N. today?

- | | |
|-------|------------------|
| 1. 50 | 6. 100 |
| 2. 60 | 7. 110 |
| 3. 70 | 8. 120 |
| 4. 80 | 9. None of these |
| 5. 90 | |

22. How many bottles of beer does the average truck driver consume annually?

- | | |
|--------|--------|
| 1. 25 | 6. 250 |
| 2. 50 | 7. 300 |
| 3. 75 | 8. 350 |
| 4. 100 | 9. 400 |
| 5. 200 | |

23. How long is the Hudson River?

- | | |
|-------------|-------------------|
| 1. 2 miles | 6. 12 miles |
| 2. 3 miles | 7. 120 miles |
| 3. 6 miles | 8. 150 miles |
| 4. 8 miles | 9. Over 150 miles |
| 5. 10 miles | |

24. What is the average family debt, including mortgages?

- | | |
|------------|-------------|
| 1. \$1,000 | 6. \$7,500 |
| 2. \$2,000 | 7. \$10,000 |
| 3. \$3,000 | 8. \$15,000 |
| 4. \$4,000 | 9. \$17,500 |
| 5. \$5,000 | |

25. How many pages in a standard size Bible?

- | | |
|--------|-------------|
| 1. 150 | 6. 400 |
| 2. 200 | 7. 450 |
| 3. 250 | 8. 500 |
| 4. 300 | 9. Over 500 |
| 5. 350 | |

26. How deep is the typical oil well?

- | | |
|--------------|--------------------|
| 1. 1000 feet | 6. 4,000 feet |
| 2. 2000 feet | 7. 5,000 feet |
| 3. 2500 feet | 8. Under 1000 feet |
| 4. 3000 feet | 9. Over 5,000 feet |
| 5. 3500 feet | |

27. What is the age of the average mother-in-law?

- | | |
|-------|-------|
| 1. 30 | 6. 49 |
| 2. 35 | 7. 50 |
| 3. 40 | 8. 52 |
| 4. 45 | 9. 55 |
| 5. 47 | |

28. At what speed do most fatal car accidents occur?
- | | |
|-----------|----------------|
| 1. 35 mph | 6. 60 mph |
| 2. 40 mph | 7. 65 mph |
| 3. 45 mph | 8. 70 mph |
| 4. 50 mph | 9. Over 70 mph |
| 5. 55 mph | |
29. How many hours sleep does the average mother obtain nightly?
- | | |
|---------------|-----------------|
| 1. 4 hrs. | 6. 7 hrs. |
| 2. 5 hrs. | 7. Under 4 hrs. |
| 3. 6 hrs. | 8. Over 7 hrs. |
| 4. 6 1/2 hrs. | 9. Over 8 hrs. |
| 5. 6 3/4 hrs. | |
30. How many deep puffs to a regular-size cigarette?
- | | |
|------|------------------|
| 1. 5 | 6. 10 |
| 2. 6 | 7. 11 |
| 3. 7 | 8. 12 |
| 4. 8 | 9. None of these |
| 5. 9 | |
