Abstract

Dual language immersion (DLI) programs are in high demand throughout the southeastern United States due to the rapid increase in multilingual families moving into urban school districts. The problem addressed by this basic qualitative study is the limited knowledge of stakeholders, including kindergarten through second grade (K–2) teachers and administrators in urban districts in the southeastern United States, concerning the benefits of DLI programs for K–2 students. The purpose of this study was to explore the perspectives of educators on the benefits of primary grade DLI programs. The conceptual framework that guides this study is a combination of the ecological systems theory by Bronfenbrenner and the language acquisition theory by Krashen. Analysis of data collected during semistructured interviews with 14 educators (10 teachers and four administrators) revealed four themes regarding educators' perspectives of the benefits of DLI programs: (a) learning language through language immersion in the content areas facilitates student achievement, (b) content-integrated language teaching increases student understanding and valuing of diverse cultures, (c) teacher-child-parent-community relationships are strengthened by student bilingualism, and (d) professional development workshops (PDWs) promote advocacy for the DLI program. Data were used to develop a project that included a PDW to promote stakeholders' knowledge and understanding and develop their advocacy skills for the DLI program. The PDW includes a presentation of research findings and knowledge and skills related to content-integrated language teaching. The findings from this study may have implications for positive social change that include stakeholders in urban districts in the southeastern United States promoting DLI programs for urban school K–2 students.

Dedication

This study is dedicated to my family. First, I am thankful and grateful to God, who has made all things possible. Without him, I would not be here, nor would I have been able to complete this project study. My parents, Pedro and Elsa, for always recognized the importance of being bilingual, so, as a young girl, I studied French, English, and Spanish. My parents always showed me how to persevere, work hard, always give back and be a lifelong learner. Papi, even though you are no longer with us, this is also for you. My amazing husband, Orlando, thank you for always having faith in me and pushing me in my endeavor. It has been a long journey, and I would never have made it without you. You have been a constant rock for me always positive, and always lovingly guiding me on to finish. Susana and Maria, thank you for always supporting me and believing in me, you have both encouraged, helped, and cheered me on at all times. Karla Sofia and Alex Orlando (my beautiful children), thank you for being patient and understanding that mami had “homework.” I love you all, this doctoral journey has been a long journey, frustrating, tiring but I am blessed with a great support system. Thank you all for encouraging me to achieve this huge milestone and for stepping in to help things run smoothly in our family’s lives. I love you and want to thank you for being there for me. Lastly, thank you to my coworkers for all the support and encouragement!

Acknowledgments

As this doctoral journey comes to an end, I owe a debt of gratitude to my chair, Dr. Mary Barbara Trube. I am so grateful for your support, scholarly advice, promptness, and encouragement. Your ‘tough love,’ as I call it has made me work harder as I never wanted to let you down. I never thought I could see the light even though you continued to tell me how close I’ve been. Thank you for your plethora of information. Thank you for your patience, support, and guidance throughout this journey. You are simply the best. I admire you and I can’t thank you enough.

Dr. John Johnson, thank you for also believing in me and my work. I appreciate your support and all the feedback to ensure this comes a reality. To all my other professors through this journey, thank you! Thank you for the lessons that will last a lifetime, and for challenging me to complete my journey. What you all have taught me will go with me throughout all my endeavors.

Section 1: The Problem

The Local Problem

At one representative local urban Title I primary school, in a district in the southeastern region of the United States, there has been an increased demand for dual language immersion (DLI) programs coupled with a shortage of such programs to meet both students' needs and the interests of local parents who have monolingual or multilingual students and value bilingualism. Too few DLI programs or places in kindergarten through second grade (K–2) DLI exist for emergent bilingual students to fulfill the number of parent requests for placement of their children. The need for K–2 DLI programs in primary schools exceeds availability. This local problem—too few DLI programs—is evident from the waiting lists for student enrollment in DLI programs at the district office (curriculum director, personal communication, September 2022). At the primary school in this district, faculty meeting minutes document reports from DLI teachers on the waiting list of students whose parents, for the past four years, have wanted their children to have access to the district's K–2 DLI program. These reports include the years of virtual schooling during the COVID-19 pandemic (DLI team meeting minutes, August 19, 2022; faculty meeting minutes, August 2021).

Further support for this local need includes evidence at the district level, where DLI programs are offered in 9% of elementary schools (seven of 80 elementary schools), and waiting lists have been established at many of the schools that offer DLI. The problem is also found at the state level, where only 3% of schools statewide (71 of 2,365 schools) offer DLI programs. Data also support the need for more DLI programs across

the United States; Lam and Richards (2020) revealed that 4% of elementary schools (3,600 of 87,500) offer DLI programs.

DLI programs were created to support academic achievement, develop bilingualism, and foster biliteracy and sociocultural competence (Esposito, 2020). An estimated 1 in 5 adults in the United States speaks a second language other than English (Gration, 2022). Primary grade DLI programs are beneficial because as bilingualism increases and more children are emergent bilinguals (Ecole Bilingue, 2022). Not only do DLI programs enable cross-cultural communication, they also positively affect cognitive abilities (Ecole Bilingue, 2022). DLI programs were also created to help minority language-speaking children keep up with academic content while gaining proficiency in English. As the need for bilingual education in the United States grows so does the demand for DLI programs (Ee, 2018; Lam & Richards, 2020; Roberts, 2021). However, information on bilingual education programs is limited, and further studies are needed (Castey Moreno & Paz-Albo, 2020; del Mar Sanchez-Perez & Manzano-Agugliaro, 2021; Henderson, 2022; Olivos & Lucero, 2020).

Rationale

According to the Department of Education in the state where this study was conducted (elementary school, 2022), there are 2,365 elementary schools in the region. Only 58 of these elementary schools offer dual-language programs (elementary school, 2022). There are nearly 40,000 students in the county, and of those, only 2,500 students are enrolled in dual-language programs (Malik, 2020). Malik reported that only 900 students in a nearby county have participated in DLI programs, and another county has

1,300 students in such a program. Therefore, only 4,700 students currently benefit from dual-language programs in this state. As of 2019, there were 786,893 students in elementary schools in this state (state Department of Education, 2022).

There is evidence beyond that gathered in the local urban school district that the problem of insufficient programs to meet the needs of DLI students in schools must be addressed. Researchers have suggested that not enough is known about bilingual education programs, and further studies are needed (Castej Moreno & Paz Albo, 2020; del Mar Sanchez-Perez & Manzano-Agugliaro, 2021; Henderson, 2022; Olivos & Lucero, 2020). Castej Moreno and Paz Albo (2020) investigated the importance of bilingualism in determining students' language development and cognitive skills and found a growing demand for bilingual education programs because of these benefits. Castej Moreno and Paz Albo (2020) recommended further studies on how early childhood bilingualism grows out of and benefits from children's home and school environments. Del Mar Sanchez-Perez and Manzano-Agugliaro (2021) analyzed the growth of bilingual education programs and the research surrounding them between 1970 and 2020. These researchers noted worldwide changes during this period and recommended further studies to identify barriers to offering bilingual education (del Mar Sanchez-Perez & Manzano-Agugliaro, 2021).

Henderson (2022) explored the ideological stances of language teachers who implemented a district-wide dual language (DL) bilingual education program in a southern state and suggested that further studies are needed to understand different perspectives across different stakeholder groups such as teachers, administrators, district

officials, and district members involved in DL program implementation. Olivos and Lucero (2020) examined parents' perceptions of the benefits of bilingual education and dual programs and found that parents agree about the program's benefits. These benefits include parent involvement in helping their children with homework and reading at home at least once or twice a week. Olivos and Lucero (2020) recommended that further studies are needed on the benefits of bilingual programs, specifically an investigation of DLI programs and why parents are so satisfied with the DLI program (Olivos & Lucero, 2020). Esposito et al. (2019) explained that parents who speak English at home want their children to speak a second language as well. Therefore, the research problem addressed in this basic qualitative study was educators' perspectives on the benefits of primary grade DLI programs.

Definition of Terms

Bilingual education: When children are taught two or more languages, usually taught in their native language in concurrence with a second language (Education Corner, 2022). Children learn academic content and language simultaneously. According to Esposito (2020), bilingual education includes but is not limited to two-way DL education, one-way dual education, and immersion education models. Bilingual education involves DL and DLI models (Esposito, 2020).

Bilingualism: Fluency and accuracy in two or more different languages, coupled with the ability to handle different linguistic codes naturally and interchangeably (Zamora et al., 2019).

Biliteracy: The capability to read and write in two or more languages (Aguilar et al., 2020).

Dual language (DL) programs: DL programs are also referred to as DL immersion (DLI) or two-way immersion programs. These programs were designed for students to receive content and language instruction in a major language (e.g., English), as well as in a target language (e.g., Spanish). These programs often enroll both language-minority students (e.g., Spanish-speaking students) and language-majority students (Ee, 2018).

Immersion programs: Programs that enable biliteracy (speaking, listening, reading, and writing) in two different languages. These programs usually start in kindergarten and extend into middle school or high school (Warner, 2022).

Significance of the Study

DLI programs foster bilingualism, biliteracy, and young children's linguistic and cultural diversity consciousness (DL Education, 2022). According to Castey Moreno and Paz-Albo (2020), early childhood is a crucial period for learning one or more foreign languages. According to Participate Learning (2022), exposure to cultures in which a target language is spoken is a critical factor in students' ability to acquire more than one language in a DLI program. DLI programs give students opportunities to strengthen their cognitive potential. Tran et al. (2019) found that bilingualism has a significant effect on students' cognitive control processes. As students use selective attention, code switching, and inhibition in learning a target language, this improves their cognition (Tran et al., 2019). Further, measurements indicate this bilingualism effect is most pronounced while

students learn about cultures, and it influences students' behavioral regulation and response inhibition (Tran et al., 2019). Waterford (2019) found that a key advantage of being bilingual is literacy acquisition because young children who are exposed to multiple languages are better equipped to identify word structure in several languages at a faster pace.

Freire et al. (2022) suggested that increasing the number of DLI programs offered throughout the country is based on a crucial perspective committed to social justice and equity. Dorner and Cervantes-Soon (2020) advocated for decision makers and leaders to decide which programs would serve all students in a school district and address the learning needs of the district. Fewer than 9% (7 of 80) of schools in the school district in this study offer DLI opportunities, despite research showing that DLI schools outperform demographically similar single-language schools (Castey Moreno & Paz-Albo, 2020; Empower Language Academy, n.d.). Only 3% (71 of 2,365) of the state's elementary schools offer DLI, while the national percentage is 4% (3,600 of 87,500). Nationwide, the existence of DLI programs grew from 300 in 2,001 to slightly above 3,000 in 2015 (Lam & Richards, 2020), suggesting there are still too few programs given their track records for academic achievement. The purpose of this study was to explore the perspectives of a group of educators in the southeastern United States on the benefits of primary grade DLI programs and to increase understanding of the benefits of providing primary-grade DLI programs.

Researchers have recommended exploring context-specific challenges and mitigations to prepare DLI bilingual education teachers (Amanti et al., 2022). MacLeod

et al. (2022) recommended gaining an understanding of the way the system is evolving for individual children and families. Investigating this topic helps to better understand how Bronfenbrenner's theory, combined with bilingualism, might help the local district. Henderson (2022) also suggested exploring the diversity in language philosophies and pressures on different stakeholders involved in DLI bilingual education program implementation. In the district where this study was conducted, a low percentage of schools offer DLI Education. This research was conducted to help stakeholders understand the benefits of DLI programs and their value for K–2 students in local urban school districts.

Research Question

This basic qualitative study was conducted to explore educators' perspectives on the benefits of primary grade DLI programs. The following research question guided the study:

RQ: What are educators' perspectives on the benefits of primary grade DLI programs?

Review of the Literature

In this section, I summarize the concepts related to the benefits of DLI programs for K–2 students. These include types of encounters for DLI students, factors that influence students' academic achievement, and increased teacher–parent–community engagement (Montanari et al., 2022). My interest in conducting this study grew from recognizing that teachers and administrators aspire to better understand DLI programs to better strengthen their students' academic success. Stakeholders have agreed that teacher

and parent involvement is important for students in DLI programs (Noguerón-Liu et al., 2020). Researchers agree that understanding the way the system evolves will help children and families. Such an understanding would also help to grasp how Bronfenbrenner's theory, in combination with bilingualism, operates in communities (MacLeod et al., 2022). Investigating DLI programs as well as parents' satisfaction is essential (Olivos & Lucero, 2020). However, I was unable to locate studies on the benefits of DLI programs in primary grades and how teachers design lesson plans to help students succeed. Therefore, this basic qualitative study, using interviews, was undertaken to address the problem in local schools by exploring teachers' and administrators' perceptions about the benefits of primary grade DLI programs. The literature review also includes a conceptual framework subsection that explains how it guided the study, as well as additional subsections citing other studies that used concepts within that framework.

Conceptual Framework

The conceptual framework that guided this qualitative study was a combination of Bronfenbrenner et al.'s (2007) ecological systems theory and Krashen's (1981) language acquisition theory. Bronfenbrenner viewed development as a transactional process for humans, with interactions from different domains of the environment, each of which help influence each development. This ecological systems theory, focusing on how interactions influence a child's development in their family, school, peer group, and community (Bronfenbrenner et al., 2007), was used in my conceptual framework. Language acquisition theory proposes that young children acquire a second or more

language in the same manner as their first language (Krashen, 1981). That conceptual framework relates to my problem and purpose as I was exploring educators' (teachers and administrators) perspectives on the benefits of DLI in K–2 programs. By framing my study this way, I explored stakeholders' perspectives on the influences of a child's microsystem (home), mesosystem (school), and ecosystem (community) regarding the benefits of DLI bilingual education programs. Language is acquired during meaningful interaction in that language, with natural communication at home, in school, and in the district. In straightforward communication, speakers are primarily concerned with understanding what is said, and so the aim of language is to be comprehensible.

Ecological System Theory

Bronfenbrenner, a Russian American psychologist, created a theoretical framework that is widely known and influential in the fields of human development and education (Velez-Agosto et al., 2017). In this theory, Bronfenbrenner (1979) suggested that human development throughout a lifespan is a mixture of changes in one's immediate environments. In writing about culture, Bronfenbrenner noted that it is a dynamic system in which communication involving language and interpretation is practiced daily. Meaning changes within the context of social communities where communication is exchanged. According to Bronfenbrenner's ecological systems theory, this dynamic occurs in five different domains: the microsystem, the mesosystem, the exosystem, the macrosystem, and the chronosystem.

The first layer, the microsystem, involves relationships and interactions that directly influence the child, usually within the home. This might occur in a place where a

participant engages in an activity with a particular role, at a particular time, in a complex of relations (Bronfenbrenner, 1979). The second layer, the mesosystem, refers to how key settings a person develops within interrelate at a certain point in their lives. These interactions happen within family, school, and peer groups and in settings such as church or camp. The mesosystem is considered a system of microsystems. What a child learns at school or daycare may change the way they interact with their parents or siblings at home and vice versa. The same interrelation occurs in the process of a child's learning and development (Bronfenbrenner, 1979).

The exosystem is the third layer and is considered an extension of the mesosystem, but with more detailed social structures (formal and informal). These events do not emerge from within the person, but from an external environment having an impact on development, usually from within the community. Such events could include, for example, how a divorce affects a child's behavior in the classroom or in any environment having developmental significance. These ecological changes help to form the different courses and content of human development (Bronfenbrenner, 1979).

The fourth layer, the macrosystem, refers to general models that exist in a culture or subculture that set patterns for structures and activities happening at the concrete level. These could be considered blueprints of how some institutions may work and tend to be informal and implicit, with little direct impact on development. (Bronfenbrenner, 1979). The fifth and last layer of the Bronfenbrenner's ecological system is the chronosystem. This layer refers to lifetime changes that include how both external systems and internal systems evolve over time and how this evolution affects the development of a child

(Charles, 2021). Such changes, which include major life transitions and historical events, help influence a child's development (Bronfenbrenner's 1979).

Language Acquisition Theory

Language acquisition theory was developed by American linguist Krashen (1981), who built upon Chomsky's theory that humans have an essential capacity for language. This capacity has allowed children to learn language by trial and error or for language to grow out of involvement in a comprehensible environment. Krashen added to this idea by suggesting that learning a second language is similar to how children learn their first language, through trial and error and meaningful communicative interface (Billings, 2021). Acquiring a language is an unconscious, implicit process arising from a natural drive to find meaning in particular messages (Patrick, 2019). In essence, every student has the capacity to learn a new language, as students' brains are programmed to speak languages, and the adults in children's lives need to understand how to facilitate that acquisition.

Theories important to language acquisition also include the work of Cummins (2008), who elaborated on Krashen's work. Cummins introduced basic interpersonal communication skills (BICS) and cognitive academic language proficiency (CALP) in 1979 (Amitabh Vikram Dwivedi, 2021). The relationships between academic and social language skills challenge second language learners when competing linguistically with their peers in academic settings. BICS describes the oral fluency of a learner, whereas CALP describes the process of understanding and expressing ideas and concepts in writing and oral forms (Amitabh Vikram Dwivedi, 2021).

Alignment of Concepts

Bronfenbrenner's theory offers insights about and implications for how a social environment can influence human development and behavior (Charles, 2021). Krashen's theory explains that language is culturally rooted as well as cognitively linguistic, which is why meaningful communication interface is vital to acquire a second language (Billings 2021). The use of these concepts came together during this project study as it demonstrated the development of a second language.

According to the concept of communicative competence, a speaker will alter their speech to fit a given situation (Billings, 2021). Ecological systems theory and language acquisition theory combine to support both children's optimum development and language acquisition. Because language acquisition happens through interactions and trial and error, the ecological systems theory model demonstrates how interactions within the different systems help children develop language. These components come together in the mesosystem layer as each interaction (family, friends, teachers) contributes to a child's learning and development. He et al. (2022) explained how important it is to understand how children in a DLI programs adapt to their bilingual environments and how they develop academic and social competence. By understanding this, children's adaptation to their bilingual environment can fortify specific developmental needs, which can lead to higher quality programs. He et al. emphasized the need for homework and after-school activities because these activities may be helpful for children in the DLI bilingual education programs.

Previous Studies Using Components of the Conceptual Framework

Bronfenbrenner's (1979) ecological systems theory was developed to explore the growth and development of primary-level children based on their interactions with their family, school, and community. Liu and Buckingham (2022) built upon Bronfenbrenner's theory as part of their study, using Bronfenbrenner's framework to explore factors that influence the choice of language. In that study, some of the factors affecting the microsystem part of Bronfenbrenner's framework were the affiliated institution and the participants' family environment. In the mesosystem, participants had to deal with the choice of career development or family obligation due to their gender, whereas in the microsystem, participants were able to participate if husbands or mothers-in-law took care of the family. Exosystems were influenced by governmental agencies for research and journal indexing systems. Within the macrosystem, the most frequent factor was the need to protect and preserve the academic status of the target language. Liu and Buckingham (2022) identified the sorts of issues that families in the DLI programs might encounter when making decisions for their children in these programs.

In another study, Merçon et al. (2020) used Bronfenbrenner's bioecological theory to emphasize the importance as well as the complication of human development. In this study, the researchers focused on how interactions, parent-child relationships, and joint activities influenced human development. Merçon et al. also looked at the proximal processes as effective engines of development. Proximal processes were described as intricate equal interactions between two individuals that also must be extensive and enduring in the immediate environment.

Concurring with this framework, Krashen's theory refers to meaningful interaction produced by a subconscious process (Dervić & Spahić, 2018). Dervić and Spahić (2018) explained that learning a new language requires using and producing the language. This process also entails error connection and building on rules that have already been learned from a previously learned language. Krashen also stated that proficiency in a new language comes from acquiring the language not from learning it (Dervić & Spahić, 2018). Lastly, Dervić and Spahić (2018) suggested that the following factors affect learning a new language: age, classroom instructions, environmental influences, and language input.

DLI Programs

In the sections to follow, explicit details of the benefits from DLI programs will be described. A bilingual student is described as a child who is learning a second language simultaneously or sequentially. Research has suggested that learning a second language should begin as early as possible (Wallin & Cheevakumjorn, 2020).

Search Strategy

I conducted a systematic review of current literature on the benefits of DLI programs. During my studies at Walden University, I centered all my assignments in all my courses around the topic of the benefits of DLI programs and bilingualism. I have been able to collect articles for several years on this topic. I used the Walden University library to conduct in-depth searches in several databases, such as ERIC, Taylor and Francis Online, and Springer e-books. I also used Google Scholar to identify resources.

I made several appointments with Walden University's librarian to help me ensure I was accessing all the necessary resources. The search procedure was performed using the primary concepts of *bilingual education*, *dual language education*, *dual language programs*, *bilingualism*, *teacher language beliefs*, *dual language bilingual education*, *two-way immersion*, and *dual language immersion*. Secondary concepts of *bilingual brain*, *early bilingualism*, *Bronfenbrenner*, and *language acquisition* were also searched. As I continued to research and read these articles, I kept a research log and searched for common themes. During my research I only focused on recent, published within 5 years, peer-reviewed articles.

Bilingual Education Programs

Since the Civil Rights era, bilingual education, or DL education, has been hard-fought in the United States in predominantly language-minoritized communities (Cervantes-Soon et al., 2021). Thirty-nine states now offer DLI programs (Cervantes-Soon et al., 2021). DLI programs have grown immensely and now there are over 2,600 programs in the United States (Cervantes-Soon, et al., 2021).

Tabatadze (2019) explained that the political problems in the state where this project study was undertaken began with the lack of bilingual education being perceived by 78 bilingual educational policy representatives as a violation of the educational rights of ethnic minorities. The issue was the exclusive teaching of the state language rather than improving minority schools. This discrepancy was a barrier to effectively implementing bilingual educational programs as political policy. According to the state's budget and policy institute, this state's emergent bilingual enrollment grew 3.5 times

faster than the national average (Wilson, 2021). Wilson (2021) also explained that although this state educates many emergent bilingual students, it is still one of the few states that evaluates students in only one language, English. This has caused a disadvantage for many children. This discrepancy created a deficit in the graduation rates for emergent bilinguals, with only a 56.5% graduation rate for emergent bilinguals as opposed to an 80.2% graduation rate for non-emergent bilingual students (Wilson, 2021). Since the 1980s, school districts in the Southeastern United States have struggled to educate language-minoritized students, causing these states' graduation rates to be between 43.9% and 52% (Cervantes-Soon et al., 2021). These numbers were due to the two-way immersion (TWI) programs in the Southeast, where English is integrated (Cervantes-Soon et al., 2021). Cervantes-Soon et al. (2021) described the TWI as a program model that puts together two different linguistic groups of students.

DLI Programs and English Language Learners

Lam and Richards (2020) described how DLI programs are beneficial not only for English language users to obtain a new language, but also for English Language Learners. Garrity et al. (2019) noted that some programs in the United States tend not to frame bilingualism as a factor affording greater cognitive, creative, and affective advantages for minority students. Researchers found benefits were enhanced for students who they are educated in their native language as they start learning English (Cardoza & Brown, 2019). Cardoza and Brown (2019) described how newcomers who continue to have both languages in their DLI programs have significantly helped in their content instructions.

Ball et al. (2022) discussed how early exposure to bilingualism in the home benefits student's language skills. Ball et al. (2022) also showed the importance of acknowledging the value of a child's cultural identity, and how this helps increase a child's confidence and self-worth (Ball et al., 2022). Another important piece of information revealed by their research is how families are more involved when their communities are better resourced with reading materials and engaging toys, because these help families assist with educational tasks. Porto Currás et al. (2020) explained that although teachers may complain about implementation and collaboration within the bilingual programs, they are very pleased with the improvements students showed in their language skills. When students showed progress, teachers felt motivated to continue to learn and explore other pedagogical approaches and methodologies to improve their work.

Bilingual education teachers have created a community to support and encourage each other as they realized the importance of their work in these programs, and as these teachers come to understand the greater demands upon them (Porto Currás et al., 2020). According to Madorava and Laborda (2020), bilingual education brings unlimited possibilities to students and offers evidence that governments should support bilingual education. Muszyńska and Parra (2019) added that DLI programs help improve cognitive abilities in all students, as well as success in academic achievements and sociocultural integration.

Zamora et al. (2019) suggested that being exposed to more than one language not only helps students master new languages but also increased students' abilities to adapt to

unfamiliar lifestyles as they are exposed to different cultures, and ethnic or social groups. Programs offered in DLI schools allow students to acquire different sociocultural perspectives, and they support students' development of their self-esteem as they create group cohesion (Zamora et al., 2019). Zamora et al. (2019) also noted that being fluent in different languages helps individuals move to another country and acquire a job.

Zheng et al. (2022) noticed that Latinx students in the DLI programs considered bilingualism as normal and a tool for future options, while English-only students saw bilingualism as exceptional but beneficial for future success. Bernstein et al. (2021) pointed out that there has also been a change in how bilingual speakers are now viewed as valuable for national interests such as security, diplomacy, and trade. This changed view—looking at DLI from the motive of profit rather than pride—demonstrates how language acquisition can be seen to add value to employment (Bernstein et al., 2021). DLI education helps create equity as a neutral economic commodity, and this can make language acquisition programs more desirable to everyone (Bernstein et al. 2021).

Higher Academic Performance

In a recent study, Park et al. (2022) found that children who participated in the two-way DLI program showed higher performance in math on standardized test scores and faster response times in both Simon task and bivalent shape task (BST) measures, taking into account other confounding variables. Inhibitory control ability is measured by the Simon task, which presents a stimulus-response conflict task for students to complete. The BST is a nonverbal computerized test measuring the ability to discard irrelevant information and suggests that bilingual children have faster reaction time and better task

performance. Esposito (2020) explained that students show an advantage in academic performance in math across the third, fourth, and fifth grades, and in reading in the third grade. Ball et al. (2022), however, reported that children who come from English-only homes and participate in DLI programs do better on reading comprehension and irregular word reading tasks. Esposito (2020) also agreed that children in bilingual education models match or exceed their peers in academic outcomes in mainstream education models. Chung (2020) concurred that DLI programs narrow the achievement gap for all—minority, and majority students—in either reaching or exceeding grade level expectations. Students who participated in DLI excelled in oral proficiency, reading, and writing tests administered in both languages (Chung, 2020). According to Wong and Tian (2022) developing meta—linguistic awareness is also another important practice in bilingual classrooms, and having consistent exposure in a second language has led to higher levels of biliteracy and metalinguistic development.

In further research, Bibler (2021) found there were benefits for students attending DLI programs. Among these were performance improvement at the higher end of grade exam scores of about 0.09 and 0.05 standard deviations per year in math and reading. Correspondingly, Steele et al. (2017) shared their findings from a different state public school, where DLI students outperformed their peers by 13% of a standard deviation in Grade 5 on state reading tests, and by 22% of a standard deviation in Grade 8. Steele et al. (2017) explained that students' native languages made no significant difference in the program outcomes.

Peer Relationships

Another benefit to students enrolled in a two—way immersion program may accrue because teachers remain with the same group of students throughout their primary grade levels (Ayscue & Uzzell, 2022; Esposito & Bauer, 2019). The relationship that are built create a strong bond with the students, who generally are from different racial and linguistic backgrounds (Ayscue & Uzzell, 2022). When students consider themselves more bilingual, they are prouder and tend to have higher self-confidence in their abilities to do well in school (He et al., 2022). Children in the DLI programs are encouraged to work together to understand difficult math concepts, vocabulary, and reading in both English and Spanish (Uzzell & Ayscue, 2021).

DLI programs also help to create a balance of learners from different linguistic backgrounds (Ayscue & Uzzell, 2022). Non-structured time is also essential for language development (Wallin & Cheevakumjorn, 2020). Providing a general atmosphere or a period where students might freely converse and carry on nonsense conversations can create a warm and trusting environment where they feel comfortable in speaking a new language (Wallin & Cheevakumjorn, 2020). Uzzell and Ayscue (2021) explained that DLI programs help students create longlisting relationships with other students from different cultures. Also, students who participate in DLI programs benefit from different aspects of the programs. Students whose first language is the target language may benefit from having that connection with their cultural heritage, while English-dominant students gain language skills and other practical knowledge (Zheng et al., 2022). DLI programs also help build strong classroom communities as students forge special bonds with each

other. These bonds help them navigate through new content and language together as they celebrate each other's hard work and determination (Empower Language Academy, 2022).

Brain Plasticity

Our brain and its plasticity are developed based on what we have learned (Castej Moreno et al., 2020). Bilingual toddlers demonstrate a lengthy period of flexibility when it comes to interpreting potential words, so that quality positively correlates with the quantity of the speech they hear in each language. Bilingualism at an early age is biologically linked to brain development, when a second language is being learned, and the environment in which students grow up (Zamora et al., 2019). Ball et al. (2022) also explained how bilingual exposure at an earlier age gives students advantages over their monolingual peers in language and reading skills. They agreed that the earlier the child is exposed to a second language the better their language skills (phonological awareness, vocabulary). Wallin and Cheevakumjorn (2020) found that, just as in learning a first language, students need to be immersed in the sounds and daily experiences of the new language. Acquiring linguistic competences in one or more language happens very early in a child's life due to how the brain develops (Wallin & Cheevakumjorn, 2020). The younger the student, the better accent and better diversified vocabulary they will have, as opposed to a student who began learning a new language at an older age (Wallin & Cheevakumjorn, 2020).

Parent's Reasons for Choosing DLI Programs

According to current research, parents choose DLI programs for different reasons, such as developing bilingual abilities, improving academic success, and enhancing integration capabilities (Ee, 2018). Ryan (2020) also noted that families sharing the same language used that opportunity to pursue ties to their heritage. In contrast, families speaking non-native languages see options for a future where their children would benefit from proficiency in a language other than English. Ee (2018) concurred that a parent's foremost reason for choosing DLI programs is not only the development of bilingualism and biliteracy but also because they foresee greater opportunities for their children's future career-related opportunities as they encounter a global society with increased global connections. Ee (2018) explained that target language-speaking families choosing DLI programs also foresee opportunities to preserve their own home language and culture, as well as to increase their ability to communicate across intergenerational differences.

Many bilingual parents want their children to trust and value the bilingual experience that they have had and seek this same valuable experience for their children. These parents may also feel that DLI programs help them reconcile with their own language loss and give them a stronger connection to their ethnic identity. Beliefs and attitudes connected to learning a new language affect both parents and children and have an impact on how they perceive learning the language (Chung, 2020). How a child's parents regard learning a new language will influence how much or how little that child

gets out of the DLI program. Parents' beliefs and attitudes also influence how children use the language and can motivate their learning (Chung, 2020)

Bilingualism, Biliteracy, and Cultural Integration

As students are exposed to a new language in DLI programs, they benefit from gaining in bilingualism, biliteracy, and linguistic/cultural integration (Balloffet & Téllez (2021). Uzzell and Ayscue (2021) also found that throughout DLI programs, all students benefit from bilingualism, biliteracy, and biculturalism. He et al. (2022) agreed that DLI programs help students learn about cultures and understand different cultures and people within different cultures express beliefs and values of that culture. When bilingualism, biliteracy, and biculturalism are part of the curriculum, researchers found there is more rigor in what and how students learn (Uzzell & Ayscue, 2021). Students in DLI programs are more likely to persevere in their studies (Balloffet & Téllez, 2021; Garrity et al., 2019; Uzzell & Ayscue, 2021). Garrity et al. (2019) observed that 70% of the students who participate in DLI programs are habitually better problem solvers, more creative, and more tolerant than their monolingual peers. Garrity et al. (2019) expounded on that observation by noting although bilingual children maybe have different patterns of acquiring certain aspects of language, these students develop the same level of proficiency as their monolingual peers over time. Garrity et al. (2019) found that the geographic location of each program being offered may influence beliefs and support for bilingual programs. Another reason for students to participate in DLI programs is to strengthen the building of positive traits by interrelating with different racial, ethnic, and linguistic groups (Ee, 2018). He et al. (2022) described children in DLI programs as

having cross-cultural attitudes and being more positive and social than children in English-only programs. Uzzell and Ayscue (2021) suggested that DLI programs help students develop an ethnocentric view of the world, where they do not perceive non-U.S. countries as inferior. Such students are able to embrace different cultures and languages as they are exposed to them throughout the DLI programs (Uzzell & Ayscue, 2021). Students who participate in the DLI programs find both the program and what they are learning to be resourceful and authentic (Wong & Tian, 2022). DLI teachers help expand the worldviews of their students (Uzzell & Ayscue, 2021). Wong and Tian (2022) suggested that teachers help students develop a metalinguistic awareness is also an important practice in bilingual classrooms, as well as consistent exposure in the language led to higher levels of biliteracy and metalinguistic development.

Content and Language Integrated Learning

Content and language integrated learning (CLIL) infers that a second language is learned through a subject content (Oattes et al., 2022). Only the target language is used in CLIL lessons. Students' first language is discouraged during their CLIL time. To support and reinforce learning, however, the English teacher will include a short session on the students' first language vocabulary (Oattes et al., 2022). Oattes et al. (2022) conducted different studies to defend the view that the development of the subject content through a second language models diversity, due to the variety and diversity of settings presented. The CLIL method stimulates deeper learning, and its effectiveness is validated when students in the DLI programs outperform their mainstream peers. This result

demonstrates how subject content is acquired through a second language. (Castej Moreno & Paz-Albo, 2020).

Hussain (2022) clarified that CLIL is not a specific approach but a pedagogical tool. Setyaningrum and Khoiriyah (2022) argues that for CLIL to succeed, teachers need to understand how CLIL pedagogical knowledge applies to scaffold learners. Hussain (2022) explained that language is used as a learning tool, which helps the learning of the content, which, simultaneously, will help develop language acquisition. Effective communication when using a new language implies intercultural communication proficiency (Hussain, 2022). Hussain (2022) suggested implementing a CLIL program that trains teachers on its proper function in language and content teaching. CLIL is being taken into consideration more and more by ministries of education around the world. Hussain (2022) described it as having a useful impact on the internationalization of multilingualism. Setyaningrum and Khoiriyah (2022) stressed that it is also important for teachers with different backgrounds to come together for the collaborative process of planning, and recommended offering CLIL intensive workshops for teachers' professional development.

Implications

Findings from this study will determine the direction of a proposed professional development workshop (PDW) project. Such a project would be aimed at developing an expansion to more DLI programs throughout the county. Another project that might be created from this study would be to expose more children to DLI at their schools, either integrated with a subject or as a special class. The study results might also be useful in

helping policymakers see the benefits of children being bilingual from an early age. The problem investigated here placed emphasis on how to create positive social change that will open the door for future students to become bilingual.

Muszyńska and Parra (2019) described successful DLI programs as efficient in advancing language proficiency, academic achievement, and positive attitudes about learning languages. Bilingual, biliterate, and multicultural competences are also great advantages gained through the DLI programs (Muszyńska & Parra, 2019). Students who participate in a DLI program benefit from an effective curriculum ensuring that all content areas are covered; content, language, and culture are integrated; materials are varied, high quality, interesting and provided in two languages; and assessments encompass both content and language (Muszyńska & Parra, 2019).

Summary

The focus of this basic qualitative study is the limited knowledge of stakeholders, including kindergarten through second grade (K–2) teachers and administrators in urban districts in the southeastern United States, concerning the benefits of DLI programs for K–2 students. In section 1, I introduced and discussed the local problem, rationale, evidence of the problem from the professional literature, definition of terms, the significance of the study, research questions, review of the literature, conceptual framework, and implications. Section 2 will describe the study's methodology, data collection and analysis, and results.

Section 2: The Methodology

In this study, interviews were conducted to elicit and explore educators' perceptions about the benefits of DLI programs for K–2 students. The goal of the study was to help address the problem of too few DLI programs for K–2 DLI students in primary schools located in a particular district in the southeastern region of the United States. The study's results may be generalized and used to advocate for additional DLI programs. There remains a gap in the literature on why bilingual education programs are so limited, and further studies are needed (Castey Moreno & Paz-Albo., 2020; del Mar Sanchez-Perez & Manzano-Agugliaro, 2021, Henderson, 2022; Olivos & Lucero, 2020).

Research Design and Approach

In this basic qualitative research project, I used a self–designed interview protocol to gather data from participants and explore perceptions about the benefits of DLI programs for K–2 students. The conceptual framework for this study was based on the ecological systems theory of Bronfenbrenner (1979) and language acquisition by Krashen (1981). The research question that directed this study was:

RQ: What are educators' perspectives on the benefits of primary grade DLI programs?

This project study allowed me to work towards making a difference in the community by exploring perceptions of a program I am passionate about and potentially being able to offer information that might help other educators. I chose a qualitative research method because this approach is effective in eliciting contextual and idiosyncratic material crucial in uncovering real-world perceptions and attitudes (see

Truijens et al., 2022). I did not feel that a case study, focusing analysis on a single unit, would accurately give me the specific information needed for this study. Taking an ethnographic approach was also not appropriate, as this would require taking into account not only interviews but observations and documentaries. A basic interview-based qualitative study best supported my research goals and my sense of responsibility as a researcher, and I chose to design an interview protocol to gather data from participants.

To explore the benefits of primary grade DLI programs, I interviewed 10 teachers from eight schools and four administrators from four different schools. I conducted interviews with voluntary participants I did not know personally. This group of stakeholders comprised 10 teachers and four administrators, each with a minimum of 3 years working with DLI programs. These interviewees worked in several schools that offer DLI programs in a district located in the southeastern United States. Interviews were not conducted during school hours.

Participants

Population and Sampling

For this qualitative study, I explored the perspectives of a group of educators in the southeastern United States on the benefits of primary grade DLI programs. The educators in this study were K–2 teachers and administrators, and my aim was increasing understanding of the benefits of providing primary-grade DLI programs. A total of 14 volunteers participated in this study, which included 10 teachers and four administrators (two assistant principals and two principals) at various schools in a county with DLI programs. Each volunteer had a minimum of 3 years working in the DLI program. I

initially pursued volunteers by sending invitations to all participants who qualified. This method did not work, and I turned to snowball sampling and had participants reach out to peers who qualified to help me be successful in my study. Due to this change of recruitment, I was able to collect data, and the data analysis showed data saturation was reached.

Procedures for Gaining Access

I used the Walden University Institutional Review Board (IRB) manual to prepare materials and conduct this study ethically. I was also required to apply to the local IRB. After I received approval from both the Walden IRB and the local school IRB, I emailed invitation letters and consent forms to potential volunteers for the study. I sent a letter of informed consent that included information describing my study, the purpose of my research, potential risks of participating in the study, consent to the study or asking questions, and my contact information. I took measures to protect participants' rights, including confidentiality, informed consent, and protection from harm. I stored all data on a password-protected laptop and will dispose of it per Walden University requirements.

After receiving local and Walden University IRB approval, I sent emails inviting teachers who have been in the DLI programs for more than 3 years and were at local DLI schools to participate in the interview process. Enough participants are crucial for data collection (Merriam & Tisdell, 2016). The selection criteria, the study description, the research purpose, and sample interview questions were shared with the prospective participants. Walden University IRB provided the documents and process used for the

interview protocol. The documents to guide the interview process included the script, the purpose of the research, the interview questions, the rights of the participants, and information on how participants could exit the study if they desired to do so.

Establishing Researcher/Participant Relationships

To build rapport with study volunteers, I began by introducing myself in the introductory email sent to each participant. In my introduction, I expressed gratitude to each participant for choosing to be a part of the process. I also assured them that they could withdraw from the study without any consequences and for any reason. Each participant had the opportunity to ask questions or offer their thoughts or concerns. Once the invitations were all emailed, I used the snowball effect to recruit more participants. Snowball sampling is when participants refer other participants (Chambers, 2020).

I used the manual templates supplied by the IRB department at Walden University to create and structure the protocol for the interviews, and I developed 10 questions followed by prompts for teachers (see Appendix). The interview questions were based on concepts from the conceptual framework, and one research question also helped me collect data on educators' perspectives on the benefits of bilingual education. I consulted a panel of experts in DLI education to help ensure the questions were valid and on target to gather the data needed to address the research question.

Data Collection

Data were collected from volunteer interviewees working in schools where students in DLI programs are learning the target language through the content areas of math, science, and the target language's literature. Selecting suitable participants is

essential in collecting data exploring the same questions (Merriam & Tisdell, 2016), and my data collection approach highlighted the contextual and unique characteristics of a group of people in a particular context (see Truijens et al., 2022). Each interview lasted from 30–45 minutes. Basic qualitative research protocols were followed for each open-ended question, including prompts to encourage each participant to elaborate on their initial response. Rapport was established at the start of each interview, and this was followed by the interview itself, which consisted of a series of open-ended questions aligned with the study’s conceptual framework. These interview questions had been shared beforehand in person with a DLI specialist, who confirmed the interview questions were appropriately designed to elicit educators’ perspectives.

I followed two interview protocols because I interviewed two groups of stakeholders: K–2 teachers and administrators. The RQ was the same and the conceptual framework and related literature applied to both teachers and administrators. Both teachers and administrators were familiar with and understood ecological systems theory and language acquisition theory and their importance in supporting students, teachers, and families who understood the benefits of DLI programs in the urban district located in the southeastern United States. The interview questions helped the interview stay on topic and maintain consistent timing and helped me exclude any possible biases of my own (see Rubin & Rubin, 2012).

In qualitative research, saturation is the end goal when all data collection is completed. To this end, my next step, after interviewing the 14 participants who responded and volunteered, was to gather the data and begin to organize and analyze

them. After each interview, I listened to the digital audio record and transcribed the recording. These transcriptions were kept on a password-protected laptop that only I had the right to use, along with the notes I had taken during interviews that helped me reflect on interpretations and biases. The interview data were compiled manually. A code book was created and supported the data analysis process. The Microsoft Word document became the codebook for the collection and analysis of data.

A system is necessary for managing data collection. Digital audio-recorded interviews were transcribed for each participant, and all digital audio tapes were maintained on a password-protected laptop that only I had access to. I also maintained a reflective journal with notes that assisted me in checking my interpretations and/or biases and those print copies are securely kept in a locked file cabinet and will remain in my home office that only I have access to for a period of 5 years per Walden University policy. After 5 years they will be destroyed.

Ethical Protection of Human Subjects

I completed Collaborative Institutional Training Initiative (CITI) training in February 2023 to understand and follow the ethical guidelines required in conducting my research. The interview questions were designed to avoid bias. These interview questions were used for all participants in the same order and the same language. The interview protocol and script were used with all interviewees to ensure consistency. During each interview, all questions from the interview protocol were asked, and enough time was allotted for each participant to share anything that came to mind for each question. All required steps were taken to guarantee this study was done ethically. Measures were

taken for the protection of participants' rights, including confidentiality, informed consent, and protection from harm.

Before scheduling interviews, I emailed consent documents to each participant to ensure they understood the study. Each participant chose the time and date they were available to be interviewed, although all interviews took place through Zoom or Microsoft Teams. All data were stored on a password-protected laptop. The information will be disposed of per Walden University's requirements after 5 years by file deletion and shredding. The information provided by each participant has been kept confidential.

Role of the Researcher

As a researcher, I was responsible for transparently presenting the information gathered from interviews. As a graduate student working on a basic qualitative study, I planned to interact with my professors, classmates, librarians, and learning resources within the learning environment. During this study, I was the sole researcher. The opportunities to conduct interviews, record, code data, analyze results, present findings, and make recommendations for further studies were provided. I was able to reflect on the process as I carried out different roles during my study (Corlett & Mavin, 2018). I was able to interact in many different learning environments to learn about the research process, consider ethical issues, and understand my responsibilities to follow Walden University's mission for good. The findings from this study were used to continue to advocate for the benefits of DLI.

Data Analysis

In this section I discuss the data analysis processes followed in this basic qualitative study with interviews. A researcher must follow a rigorous process when analyzing qualitative data (DeSilva, 2019). First, I collected data from interviews with 10 teachers in DL education and four administrators of schools that offer DLI programs in three schools in an urban district located in the southeastern United States where I was not employed or known. I followed four steps for the data analysis process, as outlined by Castleberry and Nolan (2018). The four steps for thematic analysis were as follows: (a) transcribe the interview data, (b) conduct Level 1 coding, (c) conduct Level 2 coding, and (d) identify themes. As per Castleberry and Nolan (2018), thematic analysis made it possible for me, as the researcher, to identify patterns and categories. I also followed Saldaña's (2016) guide of analysis of codes, patterns, and categories to identify the themes that emerged from the data collected during the interview process. I also kept a reflexive journal during the interview process. As stated, Saldaña's (2016) guide was used to code and analyze the data.

During the first cycle of coding, the data were accurately transcribed. Each recording was revisited to ensure each transcript was precise. I familiarized myself with the data by listening to the transcripts multiple times. I recorded notes in my journal to address bias. I performed post-coding transition. The information was coded into cycles: single words and short phrases.

During the second cycle of coding, the information was color coded, which helped in visualizing patterns and correctly categorizing the data. I also bolded quotations

that I found meaningful. After the Second Cycle of coding, I created visual representations in the form of tables from the coded material to use as a part of the final presentation of the data.

The study's first cycle of coding was initial coding or open coding. Saldaña (2016) described this part of the coding process as an opportunity for a researcher to reflect deeply on the content of the data. The data collected revealed bilingual educators' opinions on the benefits of DLI programs at different schools. For Step 2 of the analysis, I revisited each recording to ensure each transcript was precise. In Step 3, I familiarized myself with the data by listening to the recordings multiple times to allow me to further explore the material and see which direction the data might take.

In Step 4, I reviewed my notes. I followed these steps with all 14 of my interviews. I used Saldaña's (2016) guide to code the data analysis. Saldaña's (2016) initial coding breaks down the information and thoroughly examines it, then compares its similarities and differences. During the first cycle, I aligned the conceptual framework with the codes I had created; there was no software application used during the coding process.

As recommended, I went line-by-line during the initial coding to begin the data analysis. Initially, I wrote open codes in a codes journal, and I also highlighted repeated words. Then, these open codes were put in a table for better display. As part of the initial coding, I developed an alphanumeric code for each participant. This helped ensure confidentiality for each participant and helped keep their information separate and organized.

Post-coding Transition

To begin to move to second-cycle coding after the first cycle of coding, I worked on the post-coding transition, during which there was some preparatory work to be completed. This work consisted of deciding how to move forward and determine the best method for second-cycle coding. During this process I used code mapping to reorganize the data into a list of categories to be further condensed into central themes. Throughout the post-coding transition, meaning came into focus and brought structure to the data. Following Step 5, I organized, reviewed, and analyzed the data to be coded. Categories were created, taking the data a step further than merely comparing and sorting. This is also where code charting started to become part of my data analysis. Tables were created to condense the transcribed interviews in one column into major codes in another column.

Second Cycle of Coding

After completing the post-coding transition, I moved into the second-cycle process. Saldaña (2016) explained that the second cycle of coding helps the analyst to revisit the first cycle and use its coded information to move forward into supplementary coding and further qualitative data methodology. After following Step 6, I looked for themes, and as a way of turning first-cycle coding into more meaningful categories. I was able to better understand the themes that were emerging from the data (Saldaña, 2016).

After Second Cycle Coding

Lastly, after first and second cycles of coding were complete, I created a table. From this analysis, I was able to identify themes that emerged from the interview data. These themes were also inserted to the table to create a better visual.

Evidence of Quality

Appropriate practices were taken to ensure the accuracy and credibility of the findings. I worked to ensure that data were obtained during the interview process ethically. I carefully followed the IRB manual and procedures and analyzed data by listening repeatedly to the audio tapes that were transcribed by me.

Discrepant Cases

During analysis of the study data, I encountered no evidence that would contradict the findings, and no further analysis was needed. I looked through each column of the codebook to find any discrepancies. There were no discrepant cases in the study.

Limitations

This study was limited to 14 DLI programs educators: 10 teachers and four administrators in primary schools located in an urban school district in the southeastern United States. A major limitation of this study is the generalization of educators' perspectives, as I was not able to represent the views of DLI teachers or administrators beyond those of the study's participants. By choosing just 14 educators, I could capture the thoughts and experiences of only these participants, and I may have missed out on the views of other DLI education experiences. Also, due to my specification that the participant needed at least 3 years of experience, one school that would otherwise have been included was eliminated, as this was their first year with the program. Another limitation of the study was the different levels of teaching experiences and professional development of each educator. Additionally, because I needed help recruiting teachers and administrators willing to accept to do the interview, I had to get an extension to the

local IRB. When I was getting close to the last day of approval that the local IRB gave me to complete my interviews, I had to request the approval of three more weeks to continue the interview process.

Results

At one representative local urban Title I primary school, in a district in the southeastern region of the United States, there has been an increased demand for DLI programs coupled with a shortage of such programs to meet both student needs and the interests of local parents who have monolingual or multilingual students and value bilingualism. The participants were representatives of eight of the 10 schools in this county that offer DLI programs. This district includes eight schools offering a Spanish DL, one offering French, and one offering Korean. These schools teach math and science, and second language literacy in the target language at each school. The French and Korean programs are mostly one-way immersion programs, while the Spanish programs are both one- and two-way immersion program. The programs vary due to the population at each school. At all these schools, the students are learning the target language through the content areas of math, science, and the target language's literature. The purpose of this study, therefore, was to explore the perspectives of a group of educators in southeastern United States on the benefits of primary grade DLI programs, and to increase understanding of the benefits of providing primary-grade DLI programs. The research question guiding the study:

What are educators' perspectives on the benefits of primary grade DLI programs?

The RQ was derived from the study's problem and the purpose.

After the selection of participants was completed, interviews were scheduled at times each participant selected. All interviews were hosted digitally. Each participant was asked the same questions in the same order. The open-ended interview questions were created to answer the research and guide the conceptual framework along with the help of my chair and the DLI director. There were 10 questions in total. Questions were aligned with relevant literature and the conceptual framework and were designed to help answer the research question. Data was collected Zoom interviews with 10 K-2 teachers and four administrators who met the criteria for the study. Each participant had an alpha-numeric code assigned to protect their identities. The codes were used throughout the data collection and data analysis processes, and for the final write up of the findings. After all data was collected, I followed the four steps for data analysis described by Castleberry and Nolan (2018). After I concluded each interview, I began manually transcribing voice to text. I listened to the audio recordings many times and read over the data I transcribed several times, as I referred to my reflective journal. I made notes as needed.

In order to find patterns, codes, categories, and themes I used an inductive method of coding. After all the data were transcribed and in order to keep everyone's data separate and confidential, I labeled each teacher by grade level taught, the order I interviewed them, and lastly, a letter to represent the school they represent. The alphanumeric code helped me organize the demographic of the study. For example, the first kindergarten teacher I interviewed was coded KT1A, meaning K for grade level Kindergarten T1 because she was the first teacher and A because it was the first school being represented (see sample table 1)

Table 1*Research Participants*

Participants	Current role for DLI	Gender	Program language	Nationality
KT1A	K	F	English/Spanish	Argentina/U.S.
1T1H	2	F	English/Spanish	Cuban/U.S.
KT2F	K	F	English/Korean	Ireland/U.S.
2T1C	2	M	English/Spanish	Colombian/U.S.
KT3F	K	F	English/Korean	Korean/U.S.
KT4D	K	F	English/Spanish	Puerto Rican/U.S.
1T2C	1	F	English/Spanish	United States
2T2G	2	F	English/Spanish	Dominican Republic/U.S.
2T3B	2	F	English/French	United States
2T4D	2	F	English/Spanish	Dominican Republic/U.S.
A1B	Assistant principal	F	English/French	United States
A2C	Assistant principal	M	English/Spanish	United States
A3D	Principal	F	English/Spanish	United States
A4E	Principal	M	English/Spanish	United States

First Cycle Coding

After each interview, I listened to the recording multiple times to ensure I captured all details accurately. Once I transcribed the information, I listened to the recording again to ensure I did not miss anything. I did this process for all 14 of my interviews. As recommended by Saldaña (2016), the first cycle of coding that was used was initial coding or open coding. I began looking at meaningful words for open coding. I kept a coding book, which allowed me to start seeing and creating patterns and categories from the codes (Braun & Clark, 2006). I read each transcript multiple times during this process of coding as I highlighted and wrote in my coding book key words

and phrases. During my first cycle of coding, I developed some of the following open codes: *diverse enrollment, parent involvement, culture, language in content* (see table 2).

Table 2

Sample of Open Codes

Code	Participant	Excerpt
Diverse enrollment	2T2C	“I mean it’s very diverse. some Hispanic students, some from African Americans, Europe, South America, different backgrounds.”
Parent involvement	A1B	“And the parents were involved so they could sit there and you know, be a part of that and hear their children speak and talk.”
Culture	A1B	“Incorporate their cultures within you know, certain activities or special holidays”
Language in content	A4E	“We had a huge celebration because our third graders in math, and I made sure I repeated this a ton with parents outscored the rest of our third graders, who in turn outscored the rest of the county”

Post Coding Transition

Post-coding transition helped me move from the first to the second cycle of coding. During this process, I reorganized by code mapping a select list of categories. The post coding transition, help me assign meaning and structure to the data. After patterns in the information emerged, I began to create categories. I also began to use code charting for my data analysis, making charts from both the tables I created and the coding book, organizing information into different columns and findings.

Second Cycle of Coding

The second cycle process involved reading each transcript line by line and looking at pieces of data to help establish each code’s significance. I then began to identify categories. These categories were added as a separate column on the tables. A

few examples of these categories are such as: language in content, effective communication, building relationships (Table 3).

Table 3

Samples of Codes

A priori	Open code	Participant	Excerpt
Language in content	Math	KT4D	“they’re not just learning math in Spanish, but they’re getting the math in English is not like a whole lesson, but they’re getting the most important part which is the vocabulary.”
	Science Literacy English		
Effective communication	Communication Individual students Parents	KT3F	“I only teach in Korean math, science and Korean literacy.”
		2T4D	“I think it’s great because it builds their it communication skills.”
Building relationships	Relationships Family Parent	2T3B	“The majority they have great relationships with every person in this school.”

This table shows a few samples of the a priori, open code, participant alphanumeric identifier, and excerpts from the interview. After completing the first and second cycle of coding I recognized the different categories. During the process of reviewing the categories, I found further connecting words with the same characteristics that were synthesized to generate themes. As I identified themes, I made sure to align them with the study’s overall research question. After evaluating the coding process, four themes emerged to address the research question: What are educators’ perspectives on the benefits of primary grade DLI programs? Analysis of data collected during semistructured interviews revealed four themes regarding educators’ perspectives of the

benefits of DLI programs: (a) learning language through language immersion in the content areas facilitates student achievement; (b) content-integrated language teaching increases student understanding and valuing of diverse cultures; (c) teacher-child-parent-community relationships are strengthened by student bilingualism, and (d) PDW promote advocacy for the DLI program. The themes that emerged were as follows:

Table 4

Sample of Categories and Themes

Categories	Themes
Content area immersion	Theme A: Learning language through language immersion in the content areas facilitates student achievement.
Understanding and valuing diversity	Theme B: Content-integrated language teaching increases student understanding and valuing of diverse cultures.
Getting to know your students/ building parent relationships.	Theme C: Teacher-child-parent-community relationships are strengthened by student development of bilingual skills.
Parent workshops, professional development for educators	Theme D: Professional development workshops (PDW) promote advocacy for the DLI program.

Findings of the study revealed that teachers' and administrators' perspectives of the benefits of DLI programs are:(a) learning language through language immersion in the content areas facilitates student achievement; (b) content-integrated language teaching increases student understanding and valuing of diverse cultures; (c) teacher-child-parent-community relationships are strengthened by student development of bilingualism.

Theme A: Learning Language Through Language Immersion in the Content Areas Facilitates Student Achievement

When asked how learning language through content improves student's achievement, participants' responses aligned. Participant 2T2C said:

Student's brains seems to develop faster. It amazes me how we teach the students in Spanish for example, and then they take a test in English, and they do very well. My students normally have done very well in math and science tests for several years in a row, so there is something about some kind of brain function that the kids actually do well, academically well.

Participant KT3F added a similar thought by saying, "They're using their brain more than other general classrooms. So, I feel like that becomes an exercise of understanding a language." Teacher 2T3B added, "They're learning how to read and write in English and Spanish at the same time." School administrator A4E said:

We had a huge celebration because our third graders in math, and I made sure I repeated this a ton with parents outscored the rest of our third graders, who in turn outscored the rest of the county. [These students have] taken milestones in English. They've only ever learned Spanish in math or math in Spanish, and still, they're outperforming all the other kids.

KT2F added that another benefit to students could be from having to "...switch all the time into a different language just makes you, like, become a more focused student early." A3D shared that many benefits occur, "...because again, not only are they practicing the content, so the strategies that are being used that are taught to our teachers

in professional development really help our students to be successful in the program.”

Teachers shared that the DLI program has helped many newcomer students get acclimated faster than other programs of bilingual education. Participant KT1A explained, “If they are a lower ESOL student who just moved here and has hardly any English, I think it really helps them academically understand what’s happening.”

As students take different exams, they have to use what they have learned in a different language and translate in order to perform as the tests are in English. Participant A3D explained:

So the test scores for those classes tend to be higher, which is always a shock for parents because they feel like the students are learning in a different language that that would not be the case but it is even with kindergarteners who take the second semester assessments, they tend to do better than the students who are not in the DLI program.

Participant A4E added, “I think it’s the best gifted education model that the county has as far as rigor and cognitive load.” 2T4D added “All the connections that we have to make in their brains I think it’s amazing.”

Later in the DLI experience, 4th grade, students take a test to see how much they have learned in the second language and participant A1B said, “They scored equal to or better than the high school students who took that same test and the high school students were not part of the DLI.” Participant A4E added,

I should also say that the number of students who test into gifted from DLI is a higher percentage, excuse me, the number of DLI students who test into gifted is a higher percentage than your average kiddo at the school.

Having all these benefits participant 1T2C added, “I do think if they offered more specials or something for other students who are non DLI, I think that could get them better opportunities in the future.”

All the participants, both teachers and administrators, mentioned during the interviews that learning language through content improves student achievement. The last participant, an administrator, brought it all together by explaining that some of the strategies teachers use in their classrooms come from professional development.

Theme B: Content–Integrated Language Teaching Increases Student Understanding and Valuing of Diverse Cultures

Teachers and administrators agreed that their schools are very diverse, and that the diversity in schools and the curriculum followed helps students to understand and value diversity as they interact with their peers. Teacher KT1A said, “I think we have over 30 languages spoken at school.” Another teacher KT2F said, “All of the kids, regardless of whether or not they’re in DLI, have Korean specials to learn about the Korean culture.” Learning content through a second language or content-integrated language teaching increases students’ understanding and valuing of diversity. An administrator said. “We understand how learning content through a second language supports diversity.” Most educators can see how diverse students in DLI programs help one another. KT1A described the diversity of the school as, “I think we have over 30

languages spoken at our school.” 1T2C shared, “Trying to incorporate their cultures within certain activities or special holidays. The students are getting exposure to a wide range of cultural backgrounds.” Showing students, they belong is important because it helps their learning. It also teaches other students to understand and have empathy for one another. Participant A1B added that “At our school we did French, and all of our kids came into French not knowing the language.” They continued to explain, “But once they caught on, they were pretty quick to move forward.” A1B said, “I think it helped expose them to different cultures, different practices.”

The DLI program also helps students become bilingual in the content areas. Participant 2T3B said, “They’re learning how to read and write and the English and Spanish at the same time... our students perform as well as and most of the time better than their peers.” Another great benefit according to participant 2T3B is “They are exiting from the ESOL program faster than students that are just in a regular English classroom.”

Participant 1T1H expounded on a bigger and more futuristic view she sees in the program.

It is wonderful because the future is all about knowing as many languages as you can, socially, they will be able to interact more with different students, different people, different cultures. And then emotionally, the same, they would be able to the word is communicate with other students of their same age, but with different backgrounds and in building the community.

Participant KT3F added, “There’s a lot of students who have learned a different language and they are more competitive in their careers eventually... And even knowing that all kids learn languages the best when they’re younger.” This same participant goes on “They’re using their brain more than other general classrooms. So, I feel like that becomes an exercise of understanding a language, understand our cultural understanding a different perspective.” Participant 2T3B added that it also “helps them be more empathetic and understand what it feels like when you don’t speak the language.” Participant KT3F supported this statement by saying, “When I say DLI, it’s not just about the language. Again, it’s about the culture, the perspective, and other opening doors for other languages.”

Theme C. Teacher–Child–Parent–Community Relationships Are Strengthened by Student Development of Bilingualism

Learning language through content has benefits in the home. Some families have expressed they want their children to continue to learn their own primary language. Participant 2T3B said, “Their parents speak Spanish, but a lot of the students understand but they don’t really speak it. So, it’s important for the parents that they learn the language.” 2T4D said, “I feel like they feel represented, they feel welcomed. And there’s support for parents as well.” Because parents feel welcome with DLI programs, another way to make the connection between home and school is through homework. Participant 2T4D said, “They will have homework in Spanish, they will continue to learn even though they don’t know that the language, their parents can help them at home.” KT3F continued,

The parents are actually learning how to read and speak Korean while they try that and at home...So where the homework I feel like it's a foundation of building the partnership between the school and the parents, the parents to see where their child is at, they can ask questions when the teacher can provide feedback about their child and also guide them to a different way.

Participant KT4D added "I feel that not only our students are learning the target language, but the parents as well." Participant 1T2C added, "More practice at home with their parents that can connect with their academic growth in the classroom. It also gives the opportunity for students to practice the language at home." Participant 13D said, "So we try to offer resources at home for students to practice the language along with the content." Regarding this topic, according to A4E, homework builds the opportunity "used for parents to see and hear and be able to interact a little bit in a language with which the vast majority are not familiar... nice connection just so parents can see what kids are doing." Lastly, participant 2T3B said, "DLI parents are more involved in the school than the regular student parents."

KT4D described benefits for the community and how the DLI program will help. "This program will help in the future, to have bilingual kids and bilingual communities and will be more connected to each other." 1T1H agreed and added that "students will be able to interact more with different students, different people, different cultures." Participant KT2F also expressed that DLI programs help students "live, listening, speaking, reading, writing everything, whereas they wouldn't if they were not enrolled in" the program. KT4D continued, "So I feel like this program will help in the future, to

have bilingual kids, bilingual community and will be more connected to each other.”

Participant 2T2C revealed that students are transferring their learning to outside of the classroom as “A lot of the parents say, ‘Well, we went to this Spanish restaurant and my kid basically took over.’ Some kids actually go on vacations, and they said, ‘Oh, my daughter, or my son, basically was our translator because nobody spoke English.”

Participant 2T4D added, “I think it’s very culturally responsive to our community.” As students are learning together, they go from grade level to grade level participant. A4E explained, “They have a little community within a much larger community of about 1100 kids.” Many parents in the DLI community are “a community that’s used to getting what it wants. And part of what it wants is academic success” explains participant A4E. A great opportunity for the community to be involved would be as participant 2T3B said, a “great idea if we did have an after school program that was around DLI just for them to keep practicing the language that are learning Spanish.” If different community members could partner up with the schools to create more opportunity for students. As participant A1B says their schools have “a connection with our library, the local library by our school and they love to get together and being able to have conversations that were academic focused.”

Theme D: Professional Development Workshops Share DLI Benefits and Promote Advocacy for the Program

An administrator shared the following comments in speaking about the DLI program:

In that case, we can also create professional development to help stakeholders in the DLI programs understand the importance of this benefit. Professional development on content-integrated language teaching would be beneficial for teachers and administrators to be on the same page when helping DLI students. It will also help all stakeholders (parents, community volunteers, etc..) work alongside DLI students and teachers in the various programs.

Participant A2C said,

We have worked with our parent liaison to try to come up with some parent workshops... explain the various roles that they can have in a school and to get familiar with the school and then kind of explain some of the ways that they can help support their kids at home.

Participant 2T3B suggested professional development is needed in content-integrated language teaching to “know the instructional strategies in an elementary program.”

Participant 2T3B added, “Training and professional development of teachers is probably the most important... having them understand really what it is before they step in and actually do it.”

Several administrators discussed how beneficial creating different resources during a PDW will assist stakeholders. A3D said,

Because again, not only are they practicing the content, but they’re also practicing the language and our teachers do a great job of using sentence stems to get the students to practice speaking in the Spanish language, so the strategies that are being used that are

taught to our teachers to professional development really help our students to be successful in the program.”

These are a few excerpts to show that diversity is also a very important part of DLI programs. Recognizing the importance of diversity and using it to get the most out of DLI programs will help both our students and our stakeholders. An administrator said,

Professional development focused on diversity will help us learn to connect with others, and benefit everyone. Increasing student engagement increases reading engagement. It is important to understand how to get your students engaged. As we have seen, being engaged in the classroom increases reading engagement.

A1B agreed with this statement, noting, “It gets them more engaged in the lessons if they’re really paying attention to the teacher.” A1B continued,

As they grow into adults, that ability to be bilingual, and not just in speaking the language but in writing the language and reading it. A lot of the teachers were great teachers, but they couldn’t write the language as well as they could read it.”

Giving teachers the right strategies to help students become more confident will help their teaching as they start seeing the resulting increase in students’ reading. Having professional development designed to help discover different reading strategies will enable teachers and administrators to challenge students more each day. Commenting on administrators seeking to fill positions in DLI programs, KT1A added,

If your strength is math, then teach math if it’s your strength; if your strength is reading and writing then teach language arts... I’ll record myself reading something, or I’ll make like a Google slide activity, or I’ll have them practice.”

Understanding their strengths as teachers and administrators and being able to recognize these strengths will help educators to ensure that they are meeting their students in the right place. Assisting stakeholders see many different techniques and strategies will also give them the tools to help students become more confident. Developing PDWs improves DLI programs' instruction and support. Teachers who understand that professional development has helped them become better teachers may also feel that other stakeholders will benefit and improve DLI programs and provide instruction and support for students. A2C stated,

We have worked with our parent liaison to try to come up with some parent workshops to kind of get our multilingual kids, their families and explain the various roles that they can have in a school and to get familiar with the school and then explain some of the ways that they can help support their kids at home.

This was an important comment. A number of teachers agreed that parents sometimes believe they don't understand and can't help their students. If are provided to address the concerns of parents and families, both teachers and parents will feel more confident in helping at home and at school. 2T3B explained: "I think the biggest barrier would be finding qualified teachers. I think that there are a lot of people that speak languages, but you have to have people that understand the instructional strategies... I think that teacher training and professional development of teachers is probably the most important... I think getting into classrooms and seeing it will help because DLI is not foreign language instruction, like what people are familiar with. It's so different. So, I think getting people involved and having them understand really what it is before they

step in and actually do it because they probably need to spend quite a bit, about three weeks, in the classroom before they really have a good idea of what they're going to get into.

Another reason why professional development will help stakeholders understand what DLI is and why it's the best way to support language learning is that different strategies to apply in the classroom and ways to promote reading aloud are offered or could be offered. These strategies help not only teachers but also other stakeholders. The more strategies we know the more we can implement with the students, whether is at home, school, or community.

Summary

In section 2, I discuss the methodology for this basic qualitative project study with interviews. I provide a comprehensive review of the research design and approach. The process of how the data collection and data analysis is explicitly explained during this section. In section 3, I will discuss the project that was created through this study.

Section 3: The Project

Introduction

In this section, I present the PDW that I created based on the findings from the study. The purpose of the basic qualitative study was to explore the perspectives of educators on the benefits of primary grade DLI programs. Participants were 10 K–2 teachers who taught in DLI programs in Title I schools located in the southeastern region of the United States and administrators from the different primary grade schools. All educators volunteered to participate in open–ended interviews based on the conceptual framework and current research in the field. Analysis of data collected during semistructured interviews revealed four themes regarding educators’ perspectives of the benefits of DLI programs: (a) learning language through language immersion in the content areas facilitates student achievement; (b) content–integrated language teaching increases student understanding and valuing of diverse cultures; (c) teacher–child–parent–community relationships are strengthened by student bilingualism, and (d) PDW promote advocacy for the DLI program. Data were used to develop a project that included PDWs to promote stakeholders’ knowledge and greater understanding of the DLI program. An aim of the PDW was to develop their advocacy skills to promote awareness of the benefits of the DLI program.

Rationale

The problem I sought to address by conducting this basic qualitative study is the limited knowledge of stakeholders, including K–2 teachers and administrators in urban school districts in the southeastern United States, concerning the benefits of DLI

programs for K–2 students. This problem has contributed to local districts limiting the number of DLI primary school programs, which does not meet local needs. DLI programs are in high demand throughout the southeastern United States for students from monolingual and multilingual families who desire their children to become bilingual due to the rapid increase in multilingual families moving into urban school districts.

Data collected through this interview–based study represent how teachers and administrators perceive the benefits of preparing PDW to support DLI programs. The study was conducted to address the question of how limited knowledge and understanding of the benefits of DLI programs contributes to limited availability of DLI programs for K–2 students in the United States. The study findings revealed that teachers generally believe DLI programs are beneficial for all children academically and socially. All interviewees agreed that, although such programs involve a lot of work, they are willing to participate in them because they can see how DLI programs help students.

The purpose of the project was to use the information gained from the study to create a PDW for all stakeholders (parents, teachers, administrators, and the community) involved with assisting, teaching, and supporting students in DLI programs. The goal was to help these stakeholders identify helpful research–based strategies that enhance the benefits of primary DL programs. Analysis of data collected during semistructured interviews revealed four themes regarding educators’ perspectives of the benefits of DLI programs: (a) learning language through language immersion in the content areas facilitates student achievement, (b) content–integrated language teaching increases student understanding and valuing of diverse cultures, (c) teacher–child–parent–

community relationships are strengthened by student bilingualism, and (d) PDWs promote advocacy for the DLI program.

The study's data analysis resulted in information suggesting that more stakeholders need to be better informed. Based on this finding, I created a PDW to inform stakeholders about DLI programs' benefits for primary-grade students. The workshop was designed as a 3-day PDW, but each session was a come-as-you-want session. The workshop's title was "Benefits of Primary Grade Dual Language Immersion Programs." The learning goal of this workshop was to inform stakeholders of the findings from the project study and from current literature on the subject.

Review of the Literature on PDW

To inform my work and learn more about PDWs, I used the Walden University library database, Google Scholar, and ERIC to gather literature to perform a literature review. Some examples of keywords used to search peer-reviewed articles included *what is professional development*, *professional development*, *benefits of professional development*, *professional development for early childhood teachers*, *professional development and parents*, *content language integrated learning*, and *sharing of information between parents and teachers*. I reviewed the PDW literature not only to validate the use of PDW, but to supplement information from the project study, such as themes found through the data analysis process, which were also supported by the review of literature. For example, Kaye et al. (2022) found that participants who attended PDWs were better prepared with strategies they learned to support their students.

Professional Development Workshop

PDWs for stakeholders can lead to changes in practice, impact children's learning outcomes, and improve schools. Teachers in DLI programs have asked for PDW to support teachers' effectiveness and intentionally engage target language in dialogues and reflective on their professional experiences (He et al., 2022). Germuth (2018) stated that to have participants change anything in their practice, professional development must be structured. Vance (2021) added that social connection is essential for professional development. Pham (2022) further explained that participants of a PDW develop more pedagogical skills through workshops when they are allowed to use what they have learned to develop their practices from. Also, these trainings help participants become empathetic and understand how to communicate better or find ideas to assist students (Pham, 2022). During these workshops, there are many simulations, which allow participants to self-reflect. Levin and Muchnc-Rozanov (2023) found that workshop learning increases participant self-awareness and confidence, helps them to be open toward others, and instills in them an emotional involvement in accepting others.

Content Language Integrated Learning

There are many different ways to learn a second language. Hussain (2022) described CLIL as studying a core subject while at the same time studying a language. Studies have shown that students are more likely to improve their learning if teachers acquire more math and science content knowledge (Germuth, 2018). Memon et al. (2023) found that learners who are taught through CLIL acquire a fuller vocabulary than students not taught through CLIL. Hussain (2022) explained that CLIL, which involves

curricular integration, positively influences language learning. According to Hu (2022), CLIL is considered one of the most beneficial ways to prepare students to communicate professionally and efficiently in a second language. CLIL has been transformed throughout the years and now has more potential to promote linguistic proficiency and subject discipline in knowledge, skills, and understanding (Coyle & Meyer, 2021). Coyle and Meyer (2021) also found that CLIL helps create a multilingual and multicultural environment that raises the national linguistic capital.

Enhanced Language Awareness

Understanding how learning a new language impacts an individual in many aspects is important. Language awareness is a person's unambiguous understanding of language and how it relates to executive functioning, such as its role in thinking, learning, and social life (Irani & Purmohammad, 2023). Marsh et al. (2019) described language awareness as how language achieves a primary goal in communication, while metalinguistic awareness is how language reflects on the first language. Language learners are believed to develop more metalinguistic awareness (D'Angelo & Sorace, 2022). D'Angelo and Sorace (2022) acknowledged that metalinguistic awareness strongly affects literacy and grammar-related activities. Although bilingual and monolingual students' understanding of proverbs may not differ, some studies say bilingual students outperform their monolingual peers on executive functions (Irani & Purmohammad, 2023). Language awareness also creates a bridge between the content area at school and students' backgrounds and languages (Makarova et al., 2023).

Translanguaging

Part of learning a new language also includes being able to differentiate between resources. Translanguaging is described as the flexibility to call upon different linguistic resources and contexts (Krause et al., 2022). Bilinguals engage in translanguaging and do not alternate between two languages but, instead, use different features in their linguistic system (Krause et al., 2022). Translanguaging is a component of a pedagogical practice that permits code switching when concepts are being learned (Krause et al., 2022). Makarova et al. (2023) expounded on translanguaging by describing it as a pedagogical approach and a way to be flexible in bilingual performance, as learners are stimulated to practice linguistic repertoire and knowledge.

Professional Learning Communities

A group of individuals must feel supported when they are working. To meet the professional development of DLI target teachers, professional learning communities (PLCs) were created (He et al., 2022). PLCs are popular in the United States and were created for teachers to share leadership and collaborative inquiries to support student learning and school improvement (He et al., 2022). Hernández (2022) explained that PLCs allow teacher knowledge and character to cooperatively improve the language competence and academic achievement of DLI students. Luyten and Bazo (2019) described how having PLCs has a strong impact on teaching practices. Due to the nuanced ways educators do things and how every classroom, school, and district asks for different things, it is important to come together and collaborate (Berg, 2018). Collaboration among teachers also brings together practices from various levels and

settings and gives everyone space to express themselves and take action for their students (McPartland, 2018). He et al. (2022) confirmed that PLCs are known to have a positive impact in teacher professional growth and student learning. During PLCs, administrators focus on guaranteeing equitable pedagogy and critical examination of instruction for continuous improvement and acceleration of student achievement (Hernández, 2022).

Becoming and Advocate for DLI

Students depend on their parents. According to Xiaoliang (2020) there are three types of parent involvement: guiding, lenient, and advocate. Guiding parental involvement includes those parents who have strong interactions and rules at home but have low interactions at school. Lenient parental involvement are parents who have low participation at home and at school. Lastly, advocate parental involvement are those parents who have strong school and home interactions (Xiaoliang, 2020). Griffin et al. (2021) added family engagement and participation envisages positive outcomes in children's social, emotional and behavioral, as well as literacy and mathematical skills.

Xiaoliang (2020) explained parent involvement could be things such as communication, homework, parental expectations, reading, attendance and participation, and parental styles. In this same research, Xiaoliang found that parent involvement is significantly related to academic achievement. Griffin et al. (2021) also agreed that family involvement and participation has a positive outcome across culturally and linguistic backgrounds. Xiaoliang (2020) also highlighted the importance of collaborating with teachers to create school- and home-based components for parents. Maddamsetti (2023) also expressed the important actions teachers are taking to advocate for emerging

bilingual students and their families. Many teachers may change their practice but not be aware of emerging bilingual students' linguistic and cultural needs (Maddamsetti, 2023).

Teachers must understand these needs to challenge every student. Maddamsetti (2023) described the difference between advocacy within the classroom and advocacy action beyond the classroom. Intentional curricular and pedagogical decision making to enable students' native language and advocacy beyond the classroom help look at educational resources and serve as a liaison for stakeholders and schools (Maddamsetti, 2023). Long (2023) explained that parents and the communities should be allies for the students no matter the situation. Long (2023) acknowledged the importance of reimagining how to prepare educators to engage successfully with families—to build trusting, reciprocal relationships with families and community partnerships, co-create learning pathways with families. To create a family centered and culturally responsive community, teachers, families, and administrators must work to build trust and respect to be culturally, linguistically, and socioeconomically diverse (Griffin et al., 2021). Lund et al (2022) addressed community-based participation research that includes academic research and community members as equal partners. This framework helps community members advocate for the needs of their communities. Griffin et al. (2021) also emphasized the resources needed to build trust and support by providing free learning materials to support families at home.

Project Description

A 3–day PDW was created for parents, teachers, administrators, and the community. This workshop was planned to be offered in a local community recreation

center conference room. The main objective of the PDW stipulates how they might learn about the different findings of bilingual education and how CLIL helps students learn academic content in a second language. There will be a brief overview to exhibit the study findings to stakeholders. I have received a grant to help buy resources to increase learning in the PDW. To maximize learning in the PDW, different adult learning strategies would be used to engage participants and help them to understand the content presented in the workshop. Many (2023) emphasizes the adult learning needs–based professional development, safe spaces for conversations and opportunities for collaboration. During these opportunities it would also be beneficial for exchanging ideas, sharing resources and developing a professional learning community (Many, 2023). According to Qureshi et al. (2020), social factors, collaborative learning, and engagement stimulate participant learning. During collaborative activities with others in the PDW, participants can contribute and will have time to reflect on their learning. Many different resources, such as computers, multi-media projectors, the internet, books, chart paper, handouts, sign-in sheets, evaluation forms, snacks, and stipend for last day culture celebration would be used during this PDW.

Potential Barriers

A potential barrier to this PDW could be the malfunction of technology. To avoid this, all the technology would be checked prior to the start of the presentation, and all information printed for participants. Another potential barrier could be a lack of interest in participation. To help with this, the workshop’s activities would involve active learning and collaboration, and snacks would be provided for all participants. Networking

among parents and participants would also be encouraged. The use of different resources should be a big draw to attract more attendees.

Proposal for Implementation and Timetable

In order to ensure that the presentation has the most up-to-date and helpful information, the study's findings would be shared with the county program directors, and they will be asked for their input and recommendations. Based on the information shared, recommended changes will be made. The program directors will also be asked to share the invitation to the workshop with any DLI teachers, families, or community members interested in learning more about how CLIL benefits students in the DLI programs. Due to the limited space in the local community recreation center's conference room, all sessions will be recorded, to share with other participants unable to attend.

The PDW will be hosted during summer vacation when students are not in school. The training will consist of 3 days of participants engaging in different activities. The focus for each day will be as follows: (a) Day 1, understanding findings and CLIL; (b) Day 2, CLIL in depth, creating read aloud with CLIL; and (c) Day 3, scenarios and how to make better decisions to help DLI students. Each session will allow participants to reflect and give feedback on their learning.

Roles and Responsibilities of Researcher and Others

I will host this PDW and be responsible for organizing and facilitating all the sessions. I am responsible for meeting with the program directors to organize the best PDW for all stakeholders. It is also my responsibility to invite participants, prepare all presentations to learn resources, and facilitate each session of the PDW. I am also in

charge of ensuring that the environment is a fun and engaging one for all participants. I have received a grant to help provide this PDW. The funds will be used to buy different resources and materials to help facilitate the PDW and maximize the learning. During the PDW I plan to budget a stipend for each participant to bring a dish to represent their culture. This will help end in a positive note and will help start building a bridge in the adults in charge of helping the DLI be culturally rooted.

Project Evaluation Plan

Formative Assessment

In order to get the most out of all participants, there will be formative assessments throughout the PDW. King (2023) described one of the main benefits of formative assessments as collecting data from student learning, which could be used to guide students, and also noted that formative assessments are a treasured part of teaching, as they tell us what the learners have gained from what they've previously been taught. This is the main reason to continue to use formative assessments for the PDW.

These assessments will help to evaluate the participants' overall understanding of their learning. I will be able to receive feedback on the PDW and adjust as needed. To ensure that I receive adequate feedback, each assessment will be confidential. This will allow participants to feel more comfortable about their answers. Toward the end of the day, participants will have the opportunity to give feedback on the PDW, express their satisfaction, offer any suggestions, or ask any lingering questions they may have. Menagarishvili et al. (2022) refer to feedback as a tool to help you identify what you are doing right or wrong, and help you improve or clear any misconceptions.

Overall Evaluation Goals

This PDW plan aims to give stakeholders the opportunity to gain knowledge, skills, tools, and strategies to address the influences of CLIL in the development of students in DLI classrooms. This PDW was designed to expose stakeholders to different tools, strategies, and resources that can influence the experiences that students, teachers, and families have with DLI classrooms. By the end of the PDW, each stakeholder will have gained the knowledge, dispositions, and skills to better understand the different benefits of DLI programs.

Key Stakeholders

This program was intentionally designed for specific stakeholders. The key stakeholders of this PDW are parents, teachers, administrators, and members of the community who are interested in DLI programs. These key stakeholders would most likely be interested in DLI primary grades.

Parents will be invited to attend the PDW in order to learn about the study and find ways to integrate CLIL at home. Based on the information gathered from interviews, some parents need clarification regarding DLI programs. This PDW will benefit parents of current and future students by helping them better understand the study findings. Parents will also have the opportunity to collaborate with teachers and get a better understanding of the planning that goes behind the scenes of the classroom. Parents will have the opportunity to create a better community between home (parents) and school (teachers) to better support their students.

Teachers will be invited to attend the PDW because they are the most actively involved in the DLI programs. The PDW will help them to understand the different perspectives revealed by the study, and because this PDW will also be open to stakeholders other than DLI teachers, those participants may gain new perspectives on what their DLI colleagues do on a day-to-day basis. During the PDW teachers will have the opportunity to create different resources that they could use in their classroom. Teachers will be able to work with others to receive feedback on their work and help them get more ideas for future lessons.

Administrators are a group of stakeholders who should attend the PDW because they work alongside teachers and parents. Administrators also get many questions about DLI programs at their schools. By attending the PDW, administrators may be better able to answer these questions from having gained a clearer understanding of what teachers are doing with students and why they are doing it. Administrators will also have the opportunity to work alongside teachers to provide feedback in the work that will be created during the PDW.

Any member of the community who has yet to be invited will be able to attend, as this program will be offered at a school near them. Attending the PDW is also an excellent way for community members to collaborate with the schools and form partnerships to support students' learning. Having the community attend will also expand the opportunity students will have with after school activities as new partnerships could be created to help parents and teachers to support students.

Project Implications

Social Change Implications

This project study was designed with the potential of impacting positive social change that will benefit all stakeholders who are curious about enrolling themselves or their students in a DLI program. Stakeholders include, but are not limited to, parents, teachers, administrators, and the community. This project can promote positive social change by delivering stakeholders opportunities to increase their knowledge and practices related to the benefits of primary grade DLI programs. The findings from the project study have shown the many ways that DLI programs can benefit students. The PDW was designed to help stakeholders understand and learn practices to assist students in DLI programs. The PDW will help stakeholders understand the connection between home, school, and community to maximize the future of our students.

Importance of the Project to Local Stakeholders

The findings from the project study guided the development of the PDW plan for stakeholders in local DLI programs. The PDW project has the potential to promote positive social change to benefit parents, teachers, administrators, and the community. Parents of students who speak a second language at home sometimes feel that DLI programs do not help their students and may only hinder them. This PDW can be of benefit to DLI students if those around them learn how to best assist them in learning a second language.

Importance of the Project to the Larger Context

The county where this study took place would gain from it if the knowledge presented through the PDW helps increase parents' and teachers' desire to have more DLI programs offered in the county schools. This study could also inform other counties or states interested in adding more DLI programs in their areas. Communities could, as well, use the PDW as a foundation for future planning and support when introducing or talking about DLI programs. The PDW will also help us understand different culture and how to be empathetic to all those around us as we learn a little bit more about each other.

Section 4: Reflections and Conclusions

Because bilingualism is quickly growing in the United States, schools are challenged with needing more DLI programs to support the demand (Castey Moreno & Paz-Albo, 2020). In this study, I explored the benefits of primary grade DLI programs. I designed the PDW, which may benefit any stakeholder interested in DLI programs, based on the responses provided by teachers and administrators.

In this section, I identify the project's strengths and limitations and recommend alternative approaches, developments, and changes. I reflect on the importance of this project study, its implications and applications, and recommendations for future research. Then, I present the conclusion of the study.

Project Strengths and Limitations

This project has various strengths. The first strength is the use of an interview protocol to collect quality data through semistructured interviews. This allowed me to develop a more in-depth PDW for stakeholders and establish an environment where participants were comfortable sharing their perspectives on DLI programs and in their classrooms and schools. The findings from the project study made possible a better understanding of the benefits of DLI programs and helped facilitate an effective PDW for all stakeholders.

Another strength of this project is the marginal cost for implementing it. I received a grant to help prepare for the PDW. A conference room at a local community recreation center was donated by the local manager, and the equipment needed to facilitate the training—multimedia projectors, chart paper, and other such items—is

inexpensive and easily available. I budgeted to buy books to help participants create different resources to bring back for their use. I also budgeted for food and a final culture celebration to help stakeholders experience different cultures in the community. Finally, another strength of this qualitative project study is that it may help researchers reevaluate the benefits of bilingual education and its many purposes for students (see Tabatadze, 2019).

A limitation of this study could be the potential of more participants showing up for the PDW than anticipated. Although there will be registration for this event, people may still attend without registering. To plan for this, I will create additional resource materials and be prepared to arrange additional seating if needed.

Recommendations for Alternative Approaches

A major recommendation in considering alternative approaches involves the preparation of instructional leaders to staff bilingual educational programs (Tabatadze, 2019). Tabatadze (2019) pointed out the necessity of providing adequate resources for pre-service and in-service professionals handling bilingual education and explained how crucial it is to have parent and community involvement in the life of the school. Professional development should be implemented for educators, parents, and community members to inform them of the benefits and importance of these programs to the community.

Alternative Definitions of the Problem

The problem that inspired this study was the limited knowledge of stakeholders about the benefits of DLI programs for K–2 students, which has led to limited DLI

primary school programs in the southeastern United States. An alternative approach to the problem could be for monolingual and bilingual educators to support the language, academic, and social development of all students by integrating some second language in their classrooms (Ruiz, 2020). Parents and teachers might also come together to share views on providing suitable instructions or resources to support their students in DLI programs.

Alternative Solutions to the Local Problem

An alternative approach to the PDW could have been to assign mentors as participants to arrive at the sessions. Mentors could assist when strategies are being shared and work together with participants to find strategies to support the DLI students. Additional PDWs could also be arranged to assist educators in creating different strategies to integrate into their classrooms.

Scholarship, Project Development, and Leadership and Change

For this project study, I submerged myself in organizing my study, conducted the literature review, collected, and analyzed data from each interview, and developed the PDW. As a researcher, I strove to listen without forming any bias and learned to value each participant's perspective. I learned to connect with individuals I did not know and reinforced my passion for education. A takeaway, and an area where I grew immensely, was the entire process of analyzing the data, from transcribing the interviews, to the first cycle of coding, to the second cycle, and finally to findings and conclusions.

The most significant takeaway from this study was gaining an understanding of the many different benefits of being exposed to a second language. Another insight was

coming to understand how integrating language into content really forces students to work hard in learning not only a different language but also in learning new content. Learning from the different educators throughout this process enriched my own learning.

Positive social changes that potentially could be linked with this project study relate to the data collected and the development of the PDW. The PDW was designed to create opportunities for sharing different strategies with educators so they may better help DLI students. By participating in the PDW, educators can collaborate, problem solve, and reflect as they learn more about CLIL in DLI programs, and this gives them the tools and opportunity to bring their learning to their schools and share with other educators and families.

This project was important for me and my personal growth; I work with bilingual education each day. I have learned why it is important to teach students to be bilingual, and I have also learned the importance of integrating content as part of learning a new language. I can coach other teachers and staff as I am now an expert in this topic. I will continue to improve my learning and help those around me be well informed. I will also continue to use the presentation created for this study to help other teachers and administrators.

Reflection on the Importance of the Work

One of the biggest takeaways came from my interviews, where I could suspend my bias or any opportunity of forming bias and, instead, try to think objectively as I listened and learned about another's perspectives. One of the areas that helped me grow was diving into all the different articles as I read the literature and learned new details on

a topic, I am passionate about. It was inspiring to learn how many benefits researchers have found and how many different parts of the brain come together to create new learning styles. I also learned a lot from analyzing the data, even though it was not easy. When I started to develop the project, I wanted to help address the problem of a need for more DLI programs in primary schools. The project study was created with the idea of helping stakeholders understand how CLIL benefits DLI students. I was able to design a research-based professional plan that has the potential to offer educators a framework they can use to further support bilingual students.

Implications, Applications, and Directions for Future Research

This study's findings suggest that educators learn, through different activities, how and why they can use CLIL in their classrooms and how this process has an impact on DLI programs. DLI programs have so many benefits and researchers have not fully addressed the barriers to offering them. Educators could also benefit from other studies that support strategies for CLIL in DLI programs, such as Wilson's (2021) recommendation of surveys to determine resources needed to provide excellent education for emergent bilingual students and increased funding for emergent bilingual studies.

The data collected from the interview—based project study provided ample insights on the interviewees' perspectives on the benefits of primary DLI programs. The PDW was designed based on that data and may offer educators a model to use in further supporting bilingual students. Furthermore, the study will contribute to the literature on the benefits of primary—grade DLI programs grounded in Bronfenbrenner's (1979) ecological systems theory.

Methodological, Theoretical, and Empirical Implications

This project study was limited by its necessary focus on a particular county in the southeastern part of the United States. In conducting the study, I was conscious of some of the important methodological, theoretical, and empirical implications of such a limitation. But doing interviews and having direct conversations with teachers and administrators validated my choice of methodology, and the insights gained through the interviews were valuable and useful in designing the workshop project. The qualitative study design, using open—ended questions and prompts, allowed participants to freely express their ideas and reveal their perceptions on the benefits of DLI programs in their schools. The conceptual framework that guided this qualitative study, a combination of ecological systems theory by Bronfenbrenner (Bronfenbrenner et al., 2007) and the language acquisition theory by Krashen (1981), led to implications from the study that suggest that meaningful interactions are necessary to support student’s learning and development. Lastly, the empirical implications of this study suggest that teachers and administrators are aware that DLI programs have some benefits to students’ learning. Teachers and administrators also agree that there are many strategies and programs set up that can be useful to assist with students’ learning, and help families have a better understanding the benefits of DLI programs.

Recommendations for Future Research

A recommendation for future research includes exploring the educational perspectives on the benefits of DLI programs in the upper primary grades. Another recommendation for future study could include a study on students who have graduated

after being in DLI programs all during their school years, to learn more about students' perspectives on that experience.

Conclusion

This basic qualitative study was conducted to explore the perceptions of educators on the benefits of primary grade DLI programs. Conducting this research with teachers and administrators allowed for deeper understanding from each stakeholder's perspective. The findings from this study could have a potential positive social impact when addressing the benefits of DLI programs with the implementation of the PDW on how CLIL is integrated with content. It was anticipated that this project would have a positive impact on educators by improving their confidence and ability to support DLI students and, also, by improving their understanding of CLIL in order to collaborate in providing a more successful DLI experience for students. It is hoped that educators and all other stakeholders within the DLI sector will benefit from the findings of the study and use the results to facilitate PDW activities for DLI teachers and families.

Appendix B: Educator's Interview Protocol

Interviewer's Name:
Position: Dual Language Teacher

Interview Date: _____ Interview Time: _____

Introduction

Dear Educator

Welcome and thank you for volunteering to participate in this research study. My name is _____. I am enrolled at Walden University in the Richard W. Riley College of Education pursuing a Doctoral Degree (EdD) in Early Childhood Education.

Interview Protocol

After the fourteen educators have been identified for the study, I will send each participant an email introducing myself and expressing thanks for the interest in the study. Prior to the interviews being conducted I will email a copy of the Informed Consent form to each participant for review and completion. After reviewing the Informed Consent form, volunteers will be asked to respond to the email indicating that they give their consent to participate in the study. Participants will be reminded that they can exit the study at any time.

Research Study Purpose

The purpose of this basic qualitative study is to explore the benefits of primary grade DLI programs. Data on the perspectives of educators on their thoughts of how the benefits of the dual language programs affect students' academic success will be collected in this basic qualitative study through interviews. The names of the participants will be anonymous. The interviews will be approximately forty-five to sixty minutes.

Appendix C: Interview Script

Primary Grade Stakeholders

Prior to the interview, the researcher will read:

Script: Thank you for your time and willingness to participate in this interview today. My name is ____ I am currently working on my Doctorate's Degree at Walden University. I am conducting a study to understand stakeholders' perspectives on the benefits of primary grade DLI programs. Today's interview will take about 45-60 minutes. During this time, I will ask you a series of questions about your perspective on DLI programs. I would like to have your permission to digitally record the interview for accurate documentation and will be confidential. If you would like to discontinue the interview at any time you may let me know. The data collected from this interview will be analyzed to create a deeper understanding of the benefits DLI programs will have to primary grades students. I, ____, will be the sole interviewer and researcher for this study. I have written consent forms that will note our agreeance to continue this interview. Prior to beginning, do you have any concerns or questions? If not, we will now begin with your permission. Please note, once again, you my stop at any moment, this is a completely voluntary interview and the data collected will be kept in a safe, locked computer.

Appendix D: Codes

Open Codes

Code	Participant	Excerpt
Diverse Enrollment	2T2C	“I mean it’s very diverse. some Hispanic students, some from African Americans, Europe, South America, different backgrounds.”
	KT3F	“We are a very, very diverse school.”
	1T1H	“There are lots of students and our culture in school is one of many different types of backgrounds”
School Community	KT4D	“to have bilingual kids bilingual community and will be more connected to each other..”
	1T1H	“they would be able to the word is communicate with other students of their same age, but with different backgrounds and in building the community.”
	KT3F	“community that want to raise competitive students.”
	2T2G	“I think with the teachers and peers I feel like they have to own little family and community and this cohort has been together.”
	A4E	“they have a little community within a much larger community of about 1100 kids”
A3D	“So they become like brothers and sisters and family”	
Effective Communication	2T2C	“I think it builds some confidence in the students as well that hey, I can actually communicate and I can understand when somebody else is talking.”
	A2C	“It kind of works towards their confidence and just their ability to apply what they learn and then within their communities.”
	2T4D	“It helps them develop their inner like show their inner artistic self and their communication skills and their I don’t know, their confidence so I think it’s really good”
Parent involvement	2T4D	“And there’s very good communication with parents, to teacher to school communication.”
	A1B	“Sometimes the parents and even the students get that elitist kind of attitude toward it.”

	A1B	“And the parents were involved so they could sit there and you know, be a part of that and hear their children speak and talk.”
	KT2F	“Even if their parents are helping in a different language, it helps with the connections with what they’re learning in the target language or in Korean.”
	KT3F	“They knew how to do it in English and I just had to help. I needed help from the English teacher or their parents to give them that vocabulary.”
	A4E	“And to make sure the teachers are happy, the kids are happy, the parents are happy.”
	A3D	“Even with their parents. They get to know each other very well because they work so closely together from kindergarten through fifth grade.”
Culture	KT3F	“I think this is a gate to open up the kids interest to language and culture.”
	2T4D	“I think it’s important that you support your students to grow in different ways to learn different things to accept different cultures.”
	1T2C	“Incorporate their cultures within you know, certain activities or special holidays”
	A1B	“They had to be focused. They had to learn how to communicate with two different teachers two different languages, and then learning on top of that the cultures and the history behind those languages and how the different things kind of came to be here”?
Language in Content	2T2C	“Doing the math and science in Spanish.”
	A2C	“Being able to explicit instruction in their target language within that DLI and then get some of that content in math and science as matters I’ve seen that really kind of challenged providing some rigor and some confidence.”
	2T3B	“They spend half of their day in French, math, science and literacy are taught entirely in French the same standards and academic knowledge and skills is every other kindergarten teacher in the County and then they have another teacher that teaches them reading writing and social studies in English.”

2T3B	“they’re learning this math in French, but they understand well, how do you know well, because when they take those assessments,”
A4E	“They had the English side teacher has to be reviewing vocabulary and math facts and science facts and literacy on the Spanish side”
A4E	“We had a huge celebration because our third graders in math, and I made sure I repeated this a ton with parents outscored the rest of our third graders, who in turn outscored the rest of the county”

Codes

A priori	Open Code	Participant	Excerpt
Language in Content	Math Science Literacy English	A1B	“They are doing the same thing that my math kid did last year who wasn’t in DLI”
		KT4D	“they’re not just learning math in Spanish, but they’re getting the math in English is not like a whole lesson, but they’re getting the most important part which is the vocabulary.”
		KT3F	“I only teach in Korean math, science and Korean literacy.”
Effective Communication	Communication Individual students Parents	2T3B	“So I think the parent communication piece is hugely important.”
		1T1H	“The teachers also have a lot of communication with their students.”
		2T4D	“I think it’s great because it builds their communication skills.”
Culturally responsive teaching	Diverse Empathetic Understanding Community	2T3B	“But I feel like for half the day those that don’t speak Spanish feel well those that don’t speak English feel in mind in the other in the English side. So

			that kind of helps them be more empathetic and understand what it feels like when you don't speak the language."
		1T2C	"The students are getting exposure to a wide range of cultural backgrounds."
		KT3F	"So I feel like that becomes an exercise of understanding a language understand our cultural understanding different perspective."
		2T4D	"I think it's very culturally responsive to our community."
Building relationships	Relationships Family Parent	2T2C	"And the more time they spend together, some create good relationships, but some still have a little animosity."
		2T4D	"The majority they have great relationships with every person in this school."
		A3D	"So they become like brothers and sisters and family."
		A4E	"They're a bit brother and sister ish, especially as they get on in the upper grades, but that's not a bad thing."
			"Students draw to me not because I'm African American but because I start with building a relationship with them first."
Building Vocabulary	Vocabulary Exposure Definitions	1T2C	"More exposure in their primary language, as well as exposure, and of course a second language for them as well."
		2T2C	"The vocabulary changes, the material gets a little bit harder."

A4E “They have the English side teacher has to be reviewing vocabulary and math facts and science facts and literacy on the Spanish side,

Appendix E: The Project

Benefits of Primary Grade Dual Language Immersion Programs

Purpose:

The purpose of this professional development plan is to provide stakeholders interested in the DLI program with the opportunity to receive professional development sessions. The workshop sessions were developed to expose DLI stakeholders to principles of teaching adult learners and provide them with opportunities to explore strategies and recommendations that can be employed to support CLIL to help students learn academic content in a second language. Having a professional development plan ensures that workshop sessions are structured and organized to facilitate meaningful experiences that cater to the needs and learning requirements of each participant.

Goals:

The goals of this 3-day professional development workshop are to: expose stakeholders to strategies for supporting DLI learners, provide recommendations for how CLIL helps students learn academic content in a second language, and to provide participants with opportunities to work collaboratively and make recommendations to one another. On the first day of training, the findings from the study will be shared. On the second day strategies for working with CLIL and how to strengthen their literacy skills for DLI students. On the third day, teachers will review case studies relating to CLIL instruction and collaborate to find possible solutions to the problems identified. Also, on the third day we will have the opportunity for participants to bring a dish to share their

culture with one another in order to start building a bridge to a more culturally rooted community.

Learning Outcomes:

At the end of the 3-day professional development the participants will:

- Discuss the importance of supporting CLIL instructions.
- Learn strategies for integrating content and language.
- Identify possible solutions to help better their CLIL knowledge and implementation.

Target audience:

The targeted audience for this professional development plan will be parents, teachers, administrators, and the community.

Components:

This PD will be divided into three main topics that are aligned with getting participants to appreciate CLIL and explore strategies to support DLI learners.

Day 1: Understanding findings and CLIL.

Day 2: CLIL in depth; creating read aloud with CLIL.

Day 3: Scenarios and how to make better decisions to help DLI students.

This project is designed to support stakeholders in understanding different benefits and barriers to CLIL and to gain an understanding of how to support DLI learners. Between the second and third day of the PDW participants will have the opportunity to create lessons and resources that they could potentially bring back with them to use immediately. I will provide books to help support the learning and making of

their own resources. The final day of the PDW is organized to have participants reviewing scenarios that present different lessons that we could integrate CLIL to better each instruction to obtain the best from each student. Working collaboratively participants will explore possible solutions to the scenarios presented, creating a final product.

To complement the PDW activities, trainer notes and slide shows are presented for each session. A hard copy of the slide show will be shared with participants to allow them to easily follow each day's proceedings.

Appendix F: Project Agenda

Day 1 (Slides 1-18)

9:00 a.m.	Welcome, coffee, juice, refreshments.
9:15 a.m.	Introductions
9:45 a.m.	Ice Breaker
10:00 a.m.	Whole group– Psychological Safety
10:30 a.m.	Whole group activity: Creating Norms for our Learning
10:45 a.m.	Break: refreshments, restroom, reflections with peers.
11:00 a.m.	Whole group: Study’s overview, Purpose, Findings
11:45 a.m.	Small groups share perspectives.
12:00 p.m.	Lunch on your own
1:00 p.m.	Activating Strategy as small groups
1:45 p.m.	Whole group: Why did I create a PDW
2:00 p.m.	Whole group – Learning through Content
2:50 p.m.	Closing, reflections, and survey about what everyone learned and thoughts on training.
3:00 p.m.	Dismissal

Day 2 (Slides 19-37)

9:00 a.m.	Welcome and refreshments.
9:15 a.m.	Warmer Welcome
9:45 a.m.	Whole group - CLIL
10:20 a.m.	Small group activity: Using the flipchart paper, design and draw an engaging and inviting learning environment to discuss the experiences that will occur.
10:45 a.m.	Break: refreshments, restrooms, reflections with peers.
11:00 a.m.	Whole group – Tips for CLIL and Read Aloud
11:45 p.m.	Small group activity – Partner up to think about creating a read aloud for DLI students using CLIL
12:00 p.m.	Lunch on your own.
1:00 p.m.	Continue Small group – Start/Continue to work on your read aloud
1:30 p.m.	Debrief and perspectives what stood out for you or what someone else said.
1:45 p.m.	Independent thinking time
2:00 p.m.	Break: refreshments, restroom
2:15 p.m.	Whole group – debrief about the learning
2:50 p.m.	Closing, reflections, and survey about what everyone learned and thoughts on training.
3:00 p.m.	Dismissal

Day 3 (Slides 38 - 55)

9:00 a.m.	Welcome & Breakfast
9:15 a.m.	Warm welcome
9:45 a.m.	Debrief from earlier days – Talk with a partner, table, a different group
10:00 a.m.	Group Activity – Being resilient is important in DLI, what are your thoughts?
10:30 a.m.	Break: refreshments, restrooms
10:45 a.m.	Group activity - Around the Room: Please walk around the room and comment/respond.
11:00 a.m.	Whole group: Debrief ‘walk around the room’ activity
11:30 a.m.	Activity - applies to your students. What changes, if any, will you make with this new information?
12:00 p.m.	Lunch on your own.
1:00 p.m.	Whole group activity – participants will look at samples for read aloud and collaborate into making it DLI friendly.
1:25 p.m.	Break: refreshments, bathroom
1:30 p.m.	Whole group activity
1:50 p.m.	Closing, reflections, post survey.
2:00 p.m.	Cultural dish experience
3:00 p.m.	Dismissal

Appendix G: Presentation

Benefits of Primary Grade Dual Language Immersion Programs.

Karen Meca
Day 1 Session 1
Location: Rec Center
Time: 9-3 pm

1

Welcome & Introduction

Please be courteous and open minded

2

Agenda - Day 1

01 Ice Breaker
02 Purpose, Overview
03 Then, we will talk about this.
04 After that we will talk about this.
05 We will also talk about this.
06 And we will talk about this last.

3

Ice breaker - Would you rather?

Be your and happy or
sad and unhappy?

Speak all languages fluently or be able to speak to animals?

Would you rather lose your wallet or lose your keys?

Instructions - you will walk around the room, when I say stop you will stop and find a partner. You will answer one of the above answers and why?
Have Fun

Would you rather eat your favorite meal for every meal for the rest of your life or never be able to eat your favorite meal again?

4

How safe do you feel?

Psychological safety

Safe to challenge
Safe to collaborate
Safe to be authentic
Safe to learn
Safe to engage

5

Creating our Norms

We are a team that...

6

TIME FOR A Break

Please grab any refreshments during this time - 15 mins

7

Study's Overview

- The purpose of the study was to explore educators' perspectives of the benefits of primary grade DLI programs, which could be used as an argument to develop a project study advocating for an increase in DLI programs.
- This professional development workshop was designed from the findings of the qualitative study with interviews conducted with teachers and administrators.
- This PD workshops will take place over three days, it is open to any stakeholder and you may come to as many as the stakeholder prefer.

8

13

Group Activity

With a group, read some of the things that you discussed with your partners during the turn and talk before lunch. What are some similarities? Differences? On a sticky note, write a phrase from the text that resonated with you.

14

Development of Professional Development Workshop

15

Language Through Content

- Content and language integrated learning (CLIL)
- A second language is learned through a subject content (Oattes et al., 2022).
- Stimulates deeper learning
- Exhibuted as the students in the DLI programs are outperforming their peers who are mainstream. (Castej Moreno & Paz Albo, 2020).

16

Purpose, Goals, Learning Outcomes

- The purpose of this project was to present the information of the findings through a Professional Development Workshop (PDW), inviting all stakeholders (parents, teachers, administrators and the community)
- The goal was to help stakeholders identify research-based strategies contribute and promotes the benefits of primary dual language programs
- The learning outcoming from conducting the workshop with stakeholders is to inform all of the findings from this project study, as well as, findings from current literature on the subject matter.

9

Findings from the study

Theme A: Learning language through content improves students' achievement.

Theme B: Teaching in the DLI program teachers integrate diversity.

10

Finding Suggestions

- Professional Development Workshop
- Language through Content
- Language Awareness
- Translanguaging

11

Turn and talk

When you turn and talk:

- Turn your body
- Look at each other
- Speak to be heard
- Listen to respond
- Be quiet when you're done

Write common learning on a sticky for after lunch

12

Language Awareness

- Is a person's unambiguous understanding of language
- How language relates to executive functioning, such as
 - Its role in thinking
 - Learning
 - Social life
 - (Irani et al., 2023).
- It is how a language achieves a primary goal in communication
 - Metalinguistic awareness is how language reflects on the first language
 - Marsh (2019) described

17

Closing Activity

Triangle-Square-Circle

3 significant ideas that I took away from this lesson...

What concepts from this lesson are repeated during in my room?

What one or two questions are still circling in my head?

18

Day 2

19

Welcome

20

Review our Norms

We are a team that...

Share

Which Gordon Ramsay are you today?

How are you feeling today?
Which picture represents you? Hold up your number!

22

Content Language Integrated learning

"CLIL is not essentially a specific approach. It is, rather, a valuable pedagogical tool which is quite wide-ranging and across the board. The ground rule in CLIL is that language is utilized as a learning tool, which helps the learning of content and develops language acquisition at the same time" Hussain (2022)

23

24

What's On Your Plate?

Take a moment to reflect on all the different things "on your plate" at the moment - the joy, the worry, the stress, the unknown... jot it down!

15:00

41

42

Group Activity

With a partner or group, read one of the provided paragraphs over ways that we can be resilient as educators. On a sticky note, write a phrase from the past learning that resonated with you.

12:00

43

Walk around the room

- You will find different scenarios around the room.
- Take a sticky note with you and I want you to think about our learning
- What can you do to improve this lesson?
- What does the lesson already have in place?
- What can we remove from this lesson to make it better?

44

Activity

03:00

Mystery Squiggle- On your half sheet, turn your squiggle into your own unique masterpiece! You only have a few minutes.

- Be creative!
- Have fun!

How could you use this in your classroom/home?

How could you integrate this into other academic areas?

45

TIME FOR LUNCH!

46

Group Activity

You will walk around with your sticky notes and read the paragraphs around the room.

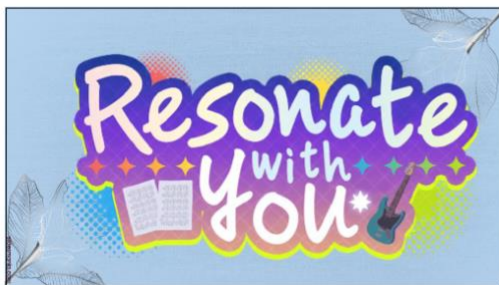

On a sticky note, write a phrase of how you can make this a DLI friendly read aloud.

Appendix H: Preparing for Advocacy

Introduction to Advocacy Plan

This is an advocacy plan for those who would like to speak to the school board at one of their meetings to advocate for more DLI programs. DLI programs are known to bring communities together. Students and families are challenged everyday as they are learning a new language as they simultaneously learn content. DLI programs are helping build students who are empathetic, multi-cultural, and most importantly bilingual and biliterate students.

Preparing for Advocacy

To help prepare for advocacy you may need:

- i. Read the following articles.
 - a. Advocating for Dual Language: It DOES Take a Village! By: Dana Hardt
 - i. <https://www.teachingforbilitery.com/advocating-for-dual-language-it-does-take-a-village/>
 - b. Bilingual Effects on Cognitive and Linguistic Development: Role of Language, Cultural Background, and Education By: Raluca Barac and Ellen Bialystok
 - i. <https://www.ncbi.nlm.nih.gov/pmc/articles/PMC3305827/>
 - c. Two is better than one: bilingual education promotes the flexible mind By: Christoffels, de Haan, Steenbergen, van den Wildenberg, Colzatot
 - i. DOI:[10.1007/s00426-014-0575-3](https://doi.org/10.1007/s00426-014-0575-3)
 - d. Bilingual Education in the United States By: Gandara and Escamilla
 - i. DOI:[10.1007/978-3-319-02258-1_33](https://doi.org/10.1007/978-3-319-02258-1_33)
- ii. The purpose of this advocacy plan is to allow all those who wish to speak to the school board at one of their meeting to advocate for more DLI programs
 - a. I would like for all attendees to write your own purpose statement to be delivered to the school board (a) thanking them for the opportunity to speak; (b) introducing yourselves and you role related to the school; (c) explaining why DLI programs are important in the community, in the neighborhoods, in the home, and in the school, (d) asking them to add more DLI programs, (e) thanking them again for providing the time to advocate for their children.

We will meet on the first Thursday of each month. To prepare for these meetings please bring notes on how you have personally seen benefits of DLI at home, school, and the community. How far is your commute to your DLI school versus your home school if it does not offer DLI. Below are a few things to consider for our first meeting.

- i. Invite anyone interested in being part of the committee.
- ii. Create a mission statement together.
- iii. Set tangible goals for the program during the school year.
